PutObjectLegalHold

The following code example shows how to use PutObjectLegalHold.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Set or modify a legal hold on an object in an S3 bucket.
public void modifyObjectLegalHold(String bucketName, String objectKey, boolean
legalHoldOn) {
    ObjectLockLegalHold legalHold ;
    if (legalHoldOn) {
        legalHold = ObjectLockLegalHold.builder()
            .status(ObjectLockLegalHoldStatus.ON)
            .build();
    } else {
        legalHold = ObjectLockLegalHold.builder()
            .status(ObjectLockLegalHoldStatus.OFF)
            .build();
    }

    PutObjectLegalHoldRequest legalHoldRequest =
PutObjectLegalHoldRequest.builder()
        .bucket(bucketName)
        .key(objectKey)
        .legalHold(legalHold)
        .build();

    getClient().putObjectLegalHold(legalHoldRequest) ;
    System.out.println("Modified legal hold for "+ objectKey +" in "+bucketName
+ ".");
}
```

- For API details, see [PutObjectLegalHold](#) in *AWS SDK for Java 2.x API Reference*.

PutObjectLockConfiguration

The following code example shows how to use PutObjectLockConfiguration.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Set the object lock configuration of a bucket.

```
// Enable object lock on an existing bucket.
public void enableObjectLockOnBucket(String bucketName) {
    try {
        VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
            .status(BucketVersioningStatus.ENABLED)
            .build();

        PutBucketVersioningRequest putBucketVersioningRequest =
PutBucketVersioningRequest.builder()
            .bucket(bucketName)
            .versioningConfiguration(versioningConfiguration)
            .build();

        // Enable versioning on the bucket.
        getClient().putBucketVersioning(putBucketVersioningRequest);
        PutObjectLockConfigurationRequest request =
PutObjectLockConfigurationRequest.builder()
            .bucket(bucketName)
            .objectLockConfiguration(ObjectLockConfiguration.builder()
                .objectLockEnabled(ObjectLockEnabled.ENABLED)
                .build())
            .build();

        getClient().putObjectLockConfiguration(request);
        System.out.println("Successfully enabled object lock on "+bucketName);

    } catch (S3Exception ex) {
        System.out.println("Error modifying object lock: '" + ex.getMessage() +
        "'");
    }
}
```

Set the default retention period of a bucket.

```
// Set or modify a retention period on an S3 bucket.
public void modifyBucketDefaultRetention(String bucketName) {
    VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
        .mfaDelete(MFADelete.DISABLED)
        .status(BucketVersioningStatus.ENABLED)
        .build();

    PutBucketVersioningRequest versioningRequest =
PutBucketVersioningRequest.builder()
        .bucket(bucketName)
        .versioningConfiguration(versioningConfiguration)
        .build();

    getClient().putBucketVersioning(versioningRequest);
    DefaultRetention rention = DefaultRetention.builder()
        .days(1)
        .mode(ObjectLockRetentionMode.GOVERNANCE)
        .build();

    ObjectLockRule lockRule = ObjectLockRule.builder()
        .defaultRetention(rention)
        .build();

    ObjectLockConfiguration objectLockConfiguration =
ObjectLockConfiguration.builder()
        .objectLockEnabled(ObjectLockEnabled.ENABLED)
        .rule(lockRule)
        .build();

    PutObjectLockConfigurationRequest putObjectLockConfigurationRequest =
PutObjectLockConfigurationRequest.builder()
        .bucket(bucketName)
        .objectLockConfiguration(objectLockConfiguration)
        .build();

    getClient().putObjectLockConfiguration(putObjectLockConfigurationRequest) ;
    System.out.println("Added a default retention to bucket "+bucketName +".");
}
```

- For API details, see [PutObjectLockConfiguration](#) in *AWS SDK for Java 2.x API Reference*.

PutObjectRetention

The following code example shows how to use PutObjectRetention.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Set or modify a retention period on an object in an S3 bucket.
public void modifyObjectRetentionPeriod(String bucketName, String objectKey) {
    // Calculate the instant one day from now.
    Instant futureInstant = Instant.now().plus(1, ChronoUnit.DAYS);

    // Convert the Instant to a ZonedDateTime object with a specific time zone.
    ZonedDateTime zonedDateTime = futureInstant.atZone(ZoneId.systemDefault());

    // Define a formatter for human-readable output.
    DateTimeFormatter formatter = DateTimeFormatter.ofPattern("yyyy-MM-dd
HH:mm:ss");

    // Format the ZonedDateTime object to a human-readable date string.
    String humanReadableDate = formatter.format(zonedDateTime);

    // Print the formatted date string.
    System.out.println("Formatted Date: " + humanReadableDate);
    ObjectLockRetention retention = ObjectLockRetention.builder()
        .mode(ObjectLockRetentionMode.GOVERNANCE)
        .retainUntilDate(futureInstant)
        .build();

    PutObjectRetentionRequest retentionRequest =
    PutObjectRetentionRequest.builder()
        .bucket(bucketName)
        .key(objectKey)
```

```

        .retention(retention)
        .build();

    getClient().putObjectRetention(retentionRequest);
    System.out.println("Set retention for "+objectKey +" in " +bucketName +"
until "+ humanReadableDate +".");
}

```

- For API details, see [PutObjectRetention](#) in *AWS SDK for Java 2.x API Reference*.

RestoreObject

Scenarios

Check if a bucket exists

The following code example shows how to check if a bucket exists.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

You can use the following `doesBucketExists` method as a replacement for the the SDK for Java V1 [AmazonS3Client#doesBucketExistV2\(String\)](#) method.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.awscore.exception.AwsServiceException;
import software.amazon.awssdk.http.HttpStatusCode;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.utils.Validate;

public class DoesBucketExist {
    private static final Logger logger =
        LoggerFactory.getLogger(DoesBucketExist.class);

    public static void main(String[] args) {
        DoesBucketExist doesBucketExist = new DoesBucketExist();

        final S3Client s3SyncClient = S3Client.builder().build();
        final String bucketName = "amzn-s3-demo-bucket"; // Change to the bucket
        name that you want to check.

        boolean exists = doesBucketExist.doesBucketExist(bucketName, s3SyncClient);
        logger.info("Bucket exists: {}", exists);
    }

    /**
     * Checks if the specified bucket exists. Amazon S3 buckets are named in a
     * global namespace; use this method to
     * 

- determine if a specified bucket name already exists, and therefore can't be
        used to create a new bucket.

     * <p>
     * Internally this method uses the <a
     * href="https://sdk.amazonaws.com/java/api/latest/software/amazon/awssdk/
     services/s3/
     S3Client.html#getBucketAcl(java.util.function.Consumer)">S3Client.getBucketAcl(String)</
     a>
     * operation to determine whether the bucket exists.
     * <p>
     * This method is equivalent to the AWS SDK for Java V1's <a
     * href="https://docs.aws.amazon.com/AWSJavaSDK/latest/javadoc/
     com/amazonaws/services/s3/AmazonS3Client.html#doesBucketExistV2-
     java.lang.String-">AmazonS3Client#doesBucketExistV2(String)</a>.
    */
}
```

```

    *
    * @param bucketName The name of the bucket to check.
    * @param s3SyncClient An S3Client instance. The method checks for
the bucket in the AWS Region
    *
    * configured on the instance.
    * @return The value true if the specified bucket exists in Amazon S3; the value
false if there is no bucket in
    *
    * Amazon S3 with that name.
    */
    public boolean doesBucketExist(String bucketName, S3Client s3SyncClient) {
        try {
            Validate.notEmpty(bucketName, "The bucket name must not be null or an
empty string.", "");
            s3SyncClient.getBucketAcl(r -> r.bucket(bucketName));
            return true;
        } catch (AwsServiceException ase) {
            // A redirect error or an AccessDenied exception means the bucket exists
but it's not in this region
            // or we don't have permissions to it.
            if ((ase.statusCode() == HttpStatusCodes.MOVED_PERMANENTLY) ||
"AccessDenied".equals(ase.awsErrorDetails().errorCode())) {
                return true;
            }
            if (ase.statusCode() == HttpStatusCodes.NOT_FOUND) {
                return false;
            }
            throw ase;
        }
    }
}

```

- For API details, see [GetBucketAcl](#) in *AWS SDK for Java 2.x API Reference*.

Create a presigned URL

The following code example shows how to create a presigned URL for Amazon S3 and upload an object.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The following shows three example of how to create presigned URLs and use the URLs with HTTP client libraries:

- An HTTP GET request that uses the URL with three HTTP client libraries
- An HTTP PUT request with metadata in headers that uses the URL with three HTTP client libraries
- An HTTP PUT request with query parameters that uses the URL with one HTTP client library

Generate a pre-signed URL for an object, then download it (GET request).

Imports.

```
import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.http.HttpExecuteRequest;
import software.amazon.awssdk.http.HttpExecuteResponse;
import software.amazon.awssdk.http.SdkHttpClient;
import software.amazon.awssdk.http.SdkHttpMethod;
import software.amazon.awssdk.http.SdkHttpRequest;
import software.amazon.awssdk.http.apache.ApacheHttpClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.GetObjectRequest;
import software.amazon.awssdk.services.s3.model.S3Exception;
import software.amazon.awssdk.services.s3.presigner.S3Presigner;
import software.amazon.awssdk.services.s3.presigner.model.GetObjectPresignRequest;
import software.amazon.awssdk.services.s3.presigner.model.PresignedGetObjectRequest;
import software.amazon.awssdk.utils.IoUtils;

import java.io.ByteArrayOutputStream;
import java.io.File;
import java.io.IOException;
import java.io.InputStream;
import java.net.HttpURLConnection;
import java.net.URISyntaxException;
```

```
import java.net.URL;
import java.net.http.HttpClient;
import java.net.http.HttpRequest;
import java.net.http.HttpResponse;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.UUID;
```

Generate the URL.

```
/* Create a pre-signed URL to download an object in a subsequent GET request. */
public String createPresignedGetUrl(String bucketName, String keyName) {
    try (S3Presigner presigner = S3Presigner.create()) {

        GetObjectRequest objectRequest = GetObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .build();

        GetObjectPresignRequest presignRequest =
            GetObjectPresignRequest.builder()
                .signatureDuration(Duration.ofMinutes(10)) // The URL will
                expire in 10 minutes.
                .getObjectRequest(objectRequest)
                .build();

        PresignedGetObjectRequest presignedRequest =
            presigner.presignGetObject(presignRequest);
        logger.info("Presigned URL: [{}]", presignedRequest.url().toString());
        logger.info("HTTP method: [{}]",
            presignedRequest.httpRequest().method());

        return presignedRequest.url().toExternalForm();
    }
}
```

Download the object by using any one of the following three approaches.

Use JDK `HttpURLConnection` (since v1.1) class to do the download.

```
/* Use the JDK HttpURLConnection (since v1.1) class to do the download. */
```

```
public byte[] useHttpURLConnectionToGet(String presignedUrlString) {
    ByteArrayOutputStream byteArrayOutputStream = new
    ByteArrayOutputStream(); // Capture the response body to a byte array.

    try {
        URL presignedUrl = new URL(presignedUrlString);
        HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
        connection.setRequestMethod("GET");
        // Download the result of executing the request.
        try (InputStream content = connection.getInputStream()) {
            IoUtils.copy(content, byteArrayOutputStream);
        }
        logger.info("HTTP response code is " + connection.getResponseCode());
    } catch (S3Exception | IOException e) {
        logger.error(e.getMessage(), e);
    }
    return byteArrayOutputStream.toByteArray();
}
```

Use JDK `HttpClient` (since v11) class to do the download.

```
/* Use the JDK HttpClient (since v11) class to do the download. */
public byte[] useHttpClientToGet(String presignedUrlString) {
    ByteArrayOutputStream byteArrayOutputStream = new
    ByteArrayOutputStream(); // Capture the response body to a byte array.

    HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
    HttpClient httpClient = HttpClient.newHttpClient();
    try {
        URL presignedUrl = new URL(presignedUrlString);
        HttpResponse<InputStream> response = httpClient.send(requestBuilder
            .uri(presignedUrl.toURI())
            .GET()
            .build(),
            HttpResponse.BodyHandlers.ofInputStream());

        IoUtils.copy(response.body(), byteArrayOutputStream);

        logger.info("HTTP response code is " + response.statusCode());
    }
```

```

    } catch (URISyntaxException | InterruptedException | IOException e) {
        logger.error(e.getMessage(), e);
    }
    return byteArrayOutputStream.toByteArray();
}

```

Use the AWS SDK for Java `SdkHttpClient` class to do the download.

```

/* Use the AWS SDK for Java SdkHttpClient class to do the download. */
public byte[] useSdkHttpClientToPut(String presignedUrlString) {

    ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.
    try {
        URL presignedUrl = new URL(presignedUrlString);
        SdkHttpRequest request = SdkHttpRequest.builder()
            .method(SdkHttpMethod.GET)
            .uri(presignedUrl.toURI())
            .build();

        HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
            .request(request)
            .build();

        try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
            HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
            response.responseBody().ifPresentOrElse(
                abortableInputStream -> {
                    try {
                        IoUtils.copy(abortableInputStream,
byteArrayOutputStream);
                    } catch (IOException e) {
                        throw new RuntimeException(e);
                    }
                },
                () -> logger.error("No response body."));

            logger.info("HTTP Response code is {}",
response.httpResponse().statusCode());
        }
    } catch (URISyntaxException | IOException e) {

```

```
        logger.error(e.getMessage(), e);
    }
    return byteArrayOutputStream.toByteArray();
}
```

Generate a pre-signed URL with metadata in headers for an upload, then upload a file (PUT request).

```

```
import java.util.UUID;
```

Generate the URL.

```
/* Create a presigned URL to use in a subsequent PUT request */
public String createPresignedUrl(String bucketName, String keyName, Map<String,
String> metadata) {
    try (S3Presigner presigner = S3Presigner.create()) {

        PutObjectRequest objectRequest = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .metadata(metadata)
            .build();

        PutObjectPresignRequest presignRequest =
PutObjectPresignRequest.builder()
            .signatureDuration(Duration.ofMinutes(10)) // The URL expires
in 10 minutes.
            .putObjectRequest(objectRequest)
            .build();

        PresignedPutObjectRequest presignedRequest =
presigner.presignPutObject(presignRequest);
        String myURL = presignedRequest.url().toString();
        logger.info("Presigned URL to upload a file to: [{}]", myURL);
        logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

        return presignedRequest.url().toExternalForm();
    }
}
```

Upload a file object by using any one of the following three approaches.

Use the JDK `HttpURLConnection` (since v1.1) class to do the upload.

```
/* Use the JDK HttpURLConnection (since v1.1) class to do the upload. */
public void useHttpURLConnectionToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
```

```

        logger.info("Begin [{}] upload", fileToPut.toString());
        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
            connection.setDoOutput(true);
            metadata.forEach((k, v) -> connection.setRequestProperty("x-amz-meta-" +
k, v));

            connection.setRequestMethod("PUT");
            OutputStream out = connection.getOutputStream();

            try (RandomAccessFile file = new RandomAccessFile(fileToPut, "r");
                FileChannel inChannel = file.getChannel()) {
                ByteBuffer buffer = ByteBuffer.allocate(8192); //Buffer size is 8k

                while (inChannel.read(buffer) > 0) {
                    buffer.flip();
                    for (int i = 0; i < buffer.limit(); i++) {
                        out.write(buffer.get());
                    }
                    buffer.clear();
                }
            } catch (IOException e) {
                logger.error(e.getMessage(), e);
            }

            out.close();
            connection.getResponseCode();
            logger.info("HTTP response code is " + connection.getResponseCode());

        } catch (S3Exception | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
}

```

Use the JDK `HttpClient` (since v11) class to do the upload.

```

/* Use the JDK HttpClient (since v11) class to do the upload. */
public void useHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
    logger.info("Begin [{}] upload", fileToPut.toString());
}

```

```

HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
metadata.forEach((k, v) -> requestBuilder.header("x-amz-meta-" + k, v));

HttpClient httpClient = HttpClient.newHttpClient();
try {
    final HttpResponse<Void> response = httpClient.send(requestBuilder
        .uri(new URL(presignedUrlString).toURI())

.PUT(HttpRequest.BodyPublishers.ofFile(Path.of(fileToPut.toURI()))
    .build(),
    HttpResponse.BodyHandlers.discarding());

    logger.info("HTTP response code is " + response.statusCode());

} catch (URISyntaxException | InterruptedException | IOException e) {
    logger.error(e.getMessage(), e);
}
}

```

Use the AWS for Java V2 SdkHttpClient class to do the upload.

```

/* Use the AWS SDK for Java V2 SdkHttpClient class to do the upload. */
public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
    logger.info("Begin [{}] upload", fileToPut.toString());

    try {
        URL presignedUrl = new URL(presignedUrlString);

        SdkHttpRequest.Builder requestBuilder = SdkHttpRequest.builder()
            .method(SdkHttpMethod.PUT)
            .uri(presignedUrl.toURI());
        // Add headers
        metadata.forEach((k, v) -> requestBuilder.putHeader("x-amz-meta-" + k,
v));

        // Finish building the request.
        SdkHttpRequest request = requestBuilder.build();

        HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
            .request(request)
            .contentStreamProvider(new
FileContentStreamProvider(fileToPut.toPath()))

```

```

        .build();

        try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
            HttpExecuteResponse response =
            sdkHttpClient.prepareRequest(executeRequest).call();
            logger.info("Response code: {}",
            response.httpResponse().statusCode());
        }
    } catch (URISyntaxException | IOException e) {
        logger.error(e.getMessage(), e);
    }
}

```

Generate a pre-signed URL with query parameters for an upload, then upload a file (PUT request).

Imports.

```

import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.awscore.AwsRequestOverrideConfiguration;
import software.amazon.awssdk.core.internal.sync.FileContentStreamProvider;
import software.amazon.awssdk.http.HttpExecuteRequest;
import software.amazon.awssdk.http.HttpExecuteResponse;
import software.amazon.awssdk.http.SdkHttpClient;
import software.amazon.awssdk.http.SdkHttpMethod;

import java.io.IOException;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.Map;
import java.util.UUID;

```

Generate the URL.

```

/**
 * Creates a presigned URL to use in a subsequent HTTP PUT request. The code
 * adds query parameters
 * to the request instead of using headers. By using query parameters, you do
 * not need to add the
 * the parameters as headers when the PUT request is eventually sent.
 *
 * @param bucketName Bucket name where the object will be uploaded.
 * @param keyName Key name of the object that will be uploaded.
 * @param queryParams Query string parameters to be added to the presigned URL.
 * @return
 */
public String createPresignedUrl(String bucketName, String keyName, Map<String,
String> queryParams) {
    try (S3Presigner presigner = S3Presigner.create()) {
        // Create an override configuration to store the query parameters.
        AwsRequestOverrideConfiguration.Builder overrideConfigurationBuilder =
        AwsRequestOverrideConfiguration.builder();

        queryParams.forEach(overrideConfigurationBuilder::putRawQueryParameter);

        PutObjectRequest objectRequest = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .overrideConfiguration(overrideConfigurationBuilder.build()) //
            Add the override configuration.
            .build();

        PutObjectPresignRequest presignRequest =
        PutObjectPresignRequest.builder()
            .signatureDuration(Duration.ofMinutes(10)) // The URL expires
            in 10 minutes.
            .putObjectRequest(objectRequest)
            .build();

        PresignedPutObjectRequest presignedRequest =
        presigner.presignPutObject(presignRequest);
        String myURL = presignedRequest.url().toString();
    }
}

```

```

        logger.info("Presigned URL to upload a file to: [{}]", myURL);
        logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

        return presignedRequest.url().toExternalForm();
    }
}

```

Use the AWS for Java V2 `SdkHttpClient` class to do the upload.

```

/**
 * Use the AWS SDK for Java V2 SdkHttpClient class to execute the PUT request.
Since the
 * URL contains the query parameters, no headers are needed for metadata, SSE
settings, or ACL settings.
 *
 * @param presignedUrlString The URL for the PUT request.
 * @param fileToPut File to uplaod
 */
public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut) {
    logger.info("Begin [{}] upload", fileToPut.toString());

    try {
        URL presignedUrl = new URL(presignedUrlString);

        SdkHttpRequest.Builder requestBuilder = SdkHttpRequest.builder()
            .method(SdkHttpMethod.PUT)
            .uri(presignedUrl.toURI());

        SdkHttpRequest request = requestBuilder.build();

        HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
            .request(request)
            .contentStreamProvider(new
FileContentStreamProvider(fileToPut.toPath()))
            .build();

        try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
            HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
            logger.info("Response code: {}",
response.httpResponse().statusCode());

```

```
    }  
    } catch (URISyntaxException | IOException e) {  
        logger.error(e.getMessage(), e);  
    }  
}
```

Create a serverless application to manage photos

The following code example shows how to create a serverless application that lets users manage photos using labels.

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Delete incomplete multipart uploads

The following code example shows how to delete or stop incomplete Amazon S3 multipart uploads.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

To stop multipart uploads that are in-progress or incomplete for any reason, you can get a list uploads and then delete them as shown in the following example.

```
/**
 * Aborts all incomplete multipart uploads from the specified S3 bucket.
 * <p>
 * This method retrieves a list of all incomplete multipart uploads in the
 * specified S3 bucket,
 * and then aborts each of those uploads.
 */
public static void abortIncompleteMultipartUploadsFromList() {
    ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
    .bucket(bucketName)
    .build();

    ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
    List<MultipartUpload> uploads = response.uploads();

    AbortMultipartUploadRequest abortMultipartUploadRequest;
    for (MultipartUpload upload : uploads) {
        abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
            .bucket(bucketName)
            .key(upload.key())
            .expectedBucketOwner(accountId)
            .uploadId(upload.uploadId())
            .build();

        AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
        if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
            logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
upload.uploadId(), bucketName);
        }
    }
}
```

```

    }
  }
}

```

To delete incomplete multipart uploads that were initiated before or after a date, you can selectively delete multipart uploads based on a point in time as shown in the following example.

```

static void abortIncompleteMultipartUploadsOlderThan(Instant pointInTime) {
    ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
    .bucket(bucketName)
    .build();

    ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
    List<MultipartUpload> uploads = response.uploads();

    AbortMultipartUploadRequest abortMultipartUploadRequest;
    for (MultipartUpload upload : uploads) {
        logger.info("Found multipartUpload with upload ID [{}], initiated [{}]",
upload.uploadId(), upload.initiated());
        if (upload.initiated().isBefore(pointInTime)) {
            abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
                .bucket(bucketName)
                .key(upload.key())
                .expectedBucketOwner(accountId)
                .uploadId(upload.uploadId())
                .build();

            AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
            if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
                logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
            }
        }
    }
}

```

If you have access to the upload ID after you begin a multipart upload, you can delete the in-progress upload by using the ID.

```
static void abortMultipartUploadUsingUploadId() {
    String uploadId = startUploadReturningUploadId();
    AbortMultipartUploadResponse response = s3Client.abortMultipartUpload(b -> b
        .uploadId(uploadId)
        .bucket(bucketName)
        .key(key));

    if (response.sdkHttpResponse().isSuccessful()) {
        logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
uploadId, bucketName);
    }
}
```

To consistently delete incomplete multipart uploads older than a certain number of days, set up a bucket lifecycle configuration for the bucket. The following example shows how to create a rule to delete incomplete uploads older than 7 days.

```
static void abortMultipartUploadsUsingLifecycleConfig() {
    Collection<LifecycleRule> lifeCycleRules = List.of(LifecycleRule.builder()
        .abortIncompleteMultipartUpload(b -> b.

Detect PPE in images

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect objects in images

The following code example shows how to build an app that uses Amazon Rekognition to detect objects by category in images.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Download S3 'directories'

The following code example shows how to download and filter the contents of Amazon S3 bucket 'directories'.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example show how to use the [S3TransferManager](#) in the AWS SDK for Java 2.x to download 'directories' from an Amazon S3 bucket. It also demonstrates how to use [DownloadFilters](#) in the request.

```
/**
 * For standard buckets, S3 provides the illusion of a directory structure
 * through the use of keys. When you upload
 * an object to an S3 bucket, you specify a key, which is essentially the "path"
 * to the object. The key can contain
 * forward slashes ("/") to make it appear as if the object is stored in a
 * directory structure, but this is just a
 * logical representation, not an actual directory.
 * <p><pre>
 * In this example, our S3 bucket contains the following objects:
 *
 * folder1/file1.txt
 * folder1/file2.txt
 * folder1/file3.txt
 * folder2/file1.txt
 * folder2/file2.txt
 * folder2/file3.txt
 * folder3/file1.txt
 * folder3/file2.txt
 * folder3/file3.txt
 *
 * When method `downloadS3Directories` is invoked with
 * `destinationPathURI` set to `/test`, the downloaded
 * directory looks like:
 *
 * |- test
 *   |- folder1
 *     |- file1.txt
 *     |- file2.txt
 *     |- file3.txt
```

```

*      |- folder3
*      |- file1.txt
*      |- file2.txt
*      |- file3.txt
* </pre>
*
* @param transferManager    An S3TransferManager instance.
* @param destinationPathURI local directory to hold the downloaded S3
'directories' and files.
* @param bucketName         The S3 bucket that contains the 'directories' to
download.
* @return The number of objects (files, in this case) that were downloaded.
*/

Lock Amazon S3 objects

The following code example shows how to work with S3 object lock features.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
import software.amazon.awssdk.services.s3.model.ObjectLockLegalHold;
```

```

import software.amazon.awssdk.services.s3.model.ObjectLockRetention;
import java.io.BufferedWriter;
import java.io.IOException;
import java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
import java.util.stream.Collectors;

/*
Before running this Java V2 code example, set up your development
environment, including your credentials.

For more information, see the following documentation topic:
https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html

This Java example performs the following tasks:
    1. Create test Amazon Simple Storage Service (S3) buckets with different lock
    policies.
    2. Upload sample objects to each bucket.
    3. Set some Legal Hold and Retention Periods on objects and buckets.
    4. Investigate lock policies by viewing settings or attempting to delete or
    overwrite objects.
    5. Clean up objects and buckets.

```

Process S3 event notifications

The following code example shows how to work with S3 event notifications in an object-oriented way.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example show how to process S3 notification event by using Amazon SQS.

```

/**
 * This method receives S3 event notifications by using an SqsAsyncClient.
 * After the client receives the messages it deserializes the JSON payload and
 * logs them. It uses
 * the S3EventNotification class (part of the S3 event notification API for
 * Java) to deserialize
 * the JSON payload and access the messages in an object-oriented way.
 *
 * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
 * notifications.

```

```

    * @see <a href="https://sdk.amazonaws.com/java/api/latest/software.amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification API</
a>.
    * <p>
    * To use S3 event notification serialization/deserialization to objects, add
the following
    * dependency to your Maven pom.xml file.
    * <dependency>
    * <groupId>software.amazon.awssdk</groupId>
    * <artifactId>s3-event-notifications</artifactId>
    * <version><LATEST></version>
    * </dependency>
    * <p>
    * The S3 event notification API became available with version 2.25.11 of the
Java SDK.
    * <p>
    * This example shows the use of the API with AWS SQS, but it can be used to
process S3 event notifications
    * in AWS SNS or AWS Lambda as well.
    * <p>
    * Note: The S3EventNotification class does not work with messages routed
through AWS EventBridge.
    */
    static void processS3Events(String bucketName, String queueUrl, String queueArn)
    {
        try {
            // Configure the bucket to send Object Created and Object Tagging
notifications to an existing SQS queue.

Track uploads and downloads

The following code example shows how to track an Amazon S3 object upload or download.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Track the progress of a file upload.

```
public void trackUploadFile(S3TransferManager transferManager, String
bucketName,
                        String key, URI filePathURI) {
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b.bucket(bucketName).key(key))
        .addTransferListener(LoggingTransferListener.create()) // Add
listener.
        .source(Paths.get(filePathURI))
        .build();

    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

    fileUpload.completionFuture().join();
    /*
        The SDK provides a LoggingTransferListener implementation of the
        TransferListener interface.
        You can also implement the interface to provide your own logic.

        Configure log4J2 with settings such as the following.
        <Configuration status="WARN">
            <Appenders>
                <Console name="AlignedConsoleAppender" target="SYSTEM_OUT">
                    <PatternLayout pattern="%m%n"/>
                </Console>
            </Appenders>

            <Loggers>
                <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                    <AppenderRef ref="AlignedConsoleAppender"/>
                </logger>
            </Loggers>
```

```

        </Configuration>

        Log4J2 logs the progress. The following is example output for a 21.3 MB
        file upload.

        Transfer initiated...
        |                               | 0.0%
        |====                         | 21.1%
        |=====                      | 60.5%
        |=====                      | 100.0%
        Transfer complete!

        */
    }

```

Track the progress of a file download.

```

    public void trackDownloadFile(S3TransferManager transferManager, String
    bucketName,

                                String key, String downloadedFilePath) {
        DownloadFileRequest downloadFileRequest = DownloadFileRequest.builder()
            .getObjectRequest(b -> b.bucket(bucketName).key(key))
            .addTransferListener(LoggingTransferListener.create()) // Add
listener.
            .destination(Paths.get(downloadedFilePath))
            .build();

```

```

        FileDownload downloadFile =
transferManager.downloadFile(downloadFileRequest);

```

```

        CompletedFileDownload downloadResult =
downloadFile.completionFuture().join();
        /*

```

The SDK provides a `LoggingTransferListener` implementation of the `TransferListener` interface.

You can also implement the interface to provide your own logic.

Configure log4J2 with settings such as the following.

```

<Configuration status="WARN">
    <Appenders>
        <Console name="AlignedConsoleAppender" target="SYSTEM_OUT">
            <PatternLayout pattern="%m%n"/>
        </Console>
    </Appenders>

```

```

        <Loggers>
            <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                <AppenderRef ref="AlignedConsoleAppender"/>
            </logger>
        </Loggers>
    </Configuration>

```

Log4J2 logs the progress. The following is example output for a 21.3 MB file download.

```

        Transfer initiated...
        |=====| 39.4%
        |=====| 78.8%
        |=====| 100.0%
        Transfer complete!

        */
    }

```

Use an [S3TransferManager](#) to [upload a local directory](#). View the [complete file](#) and [test](#).

```
import org.slf4j.Logger;
```

```
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.ObjectIdentifier;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedDirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.DirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.UploadDirectoryRequest;

import java.net.URI;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.file.Paths;
import java.util.UUID;

    public Integer uploadDirectory(S3TransferManager transferManager,
        URI sourceDirectory, String bucketName) {
        DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
        .source(Paths.get(sourceDirectory))
        .bucket(bucketName)
        .build());

        CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
        completedDirectoryUpload.failedTransfers()
            .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
        return completedDirectoryUpload.failedTransfers().size();
    }
```

- For API details, see [UploadDirectory](#) in *AWS SDK for Java 2.x API Reference*.

Upload or download large files

The following code example shows how to upload or download large files to and from Amazon S3.

For more information, see [Uploading an object using multipart upload](#).

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call functions that transfer files to and from an S3 bucket using the `S3TransferManager`.

```
public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
    URI destinationPathURI, String bucketName) {
    DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
    .destination(Paths.get(destinationPathURI))
    .bucket(bucketName)
    .build());
    CompletedDirectoryDownload completedDirectoryDownload =
directoryDownload.completionFuture().join();

    completedDirectoryDownload.failedTransfers()
        .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
    return completedDirectoryDownload.failedTransfers().size();
}
```

Upload an entire local directory.

```
public Integer uploadDirectory(S3TransferManager transferManager,
    URI sourceDirectory, String bucketName) {
    DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
    .source(Paths.get(sourceDirectory))
    .bucket(bucketName)
    .build());
    CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
    completedDirectoryUpload.failedTransfers()
        .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
}
```

```
        return completedDirectoryUpload.failedTransfers().size();
    }
```

Upload a single file.

```
public String uploadFile(S3TransferManager transferManager, String bucketName,
                        String key, URI filePathURI) {
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b.bucket(bucketName).key(key))
        .source(Paths.get(filePathURI))
        .build();

    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

    CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
    return uploadResult.response().eTag();
}
```

The code examples use the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;

import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
```

```
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.util.ArrayList;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

Use the [S3 Transfer Manager](#) on top of the [AWS CRT-based S3 client](#) to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

```
/**
 * Uploads a file to an Amazon S3 bucket using the S3TransferManager.
 *
 * @param filePath the file path of the file to be uploaded
 */
public void multipartUploadWithTransferManager(String filePath) {
    S3TransferManager transferManager = S3TransferManager.create();
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b
            .bucket(bucketName)
            .key(key))
        .source(Paths.get(filePath))
        .build();
    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
    fileUpload.completionFuture().join();
    transferManager.close();
}
```

Use the [S3Client API](#) to perform a multipart upload.

```
/**
 * Performs a multipart upload to Amazon S3 using the provided S3 client.
 *
 * @param filePath the path to the file to be uploaded
 */
public void multipartUploadWithS3Client(String filePath) {

    // Initiate the multipart upload.
```

```

        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key));
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.

                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                    .bucket(bucketName)
                    .key(key)
                    .uploadId(uploadId)
                    .partNumber(partNumber)
                    .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                    uploadPartRequest,
                    RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                    .partNumber(partNumber)
                    .eTag(partResponse.eTag())
                    .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            logger.error(e.getMessage());
        }
    }

```

```

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .uploadId(uploadId)

        .multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }

```

Use the [S3AsyncClient API](#) with multipart support enabled to perform a multipart upload.

```

/**
 * Uploads a file to an S3 bucket using the S3AsyncClient and enabling multipart
 * support.
 *
 * @param filePath the local file path of the file to be uploaded
 */
public void multipartUploadWithS3AsyncClient(String filePath) {
    // Enable multipart support.
    S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
        .multipartEnabled(true)
        .build();

    CompletableFuture<PutObjectResponse> response = s3AsyncClient.putObject(b ->
b
        .bucket(bucketName)
        .key(key),
        Paths.get(filePath));

    response.join();
    logger.info("File uploaded in multiple 8 MiB parts using S3AsyncClient.");
}

```

Upload stream of unknown size

The following code example shows how to upload a stream of unknown size to an Amazon S3 object.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use the [AWS CRT-based S3 Client](#).

```
import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;

import java.io.ByteArrayInputStream;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;

/**
 * @param s3CrtAsyncClient - To upload content from a stream of unknown size,
 * use the AWS CRT-based S3 client. For more information, see
 * https://docs.aws.amazon.com/sdk-for-java/latest/
 * developer-guide/crt-based-s3-client.html.
 * @param bucketName - The name of the bucket.
 * @param key - The name of the object.
 * @return software.amazon.awssdk.services.s3.model.PutObjectResponse - Returns
 * metadata pertaining to the put object operation.
 */
public PutObjectResponse putObjectFromStream(S3AsyncClient s3CrtAsyncClient,
String bucketName, String key) {

    BlockingInputStreamAsyncRequestBody body =
        AsyncRequestBody.forBlockingInputStream(null); // 'null' indicates a
stream will be provided later.

    CompletableFuture<PutObjectResponse> responseFuture =
        s3CrtAsyncClient.putObject(r -> r.bucket(bucketName).key(key),
body);
```

```

        // AsyncExampleUtils.randomString() returns a random string up to 100
        characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
            randomString.length());

        // Provide the stream of data to be uploaded.
        body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

        PutObjectResponse response = responseFuture.join(); // Wait for the
        response.
        logger.info("Object {} uploaded to bucket {}.", key, bucketName);
        return response;
    }
}

```

Use the [Amazon S3 Transfer Manager](#).

```

import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;

import software.amazon.awssdk.transfer.s3.model.Upload;

import java.io.ByteArrayInputStream;
import java.util.UUID;

/**
 * @param transferManager - To upload content from a stream of unknown size, use
 * the S3TransferManager based on the AWS CRT-based S3 client.
 *
 * For more information, see https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/transfer-manager.html.
 * @param bucketName - The name of the bucket.
 * @param key - The name of the object.
 * @return - software.amazon.awssdk.transfer.s3.model.CompletedUpload - The
 * result of the completed upload.
 */

```

```
public CompletedUpload uploadStream(S3TransferManager transferManager, String
bucketName, String key) {

    BlockingInputStreamAsyncRequestBody body =
        AsyncRequestBody.forBlockingInputStream(null); // 'null' indicates a
stream will be provided later.

    Upload upload = transferManager.upload(builder -> builder
        .requestBody(body)
        .putObjectRequest(req -> req.bucket(bucketName).key(key))
        .build());

    // AsyncExampleUtils.randomString() returns a random string up to 100
characters.
    String randomString = AsyncExampleUtils.randomString();
    logger.info("random string to upload: {}: length={}", randomString,
randomString.length());

    // Provide the stream of data to be uploaded.
    body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

    return upload.completionFuture().join();
}
}
```

Use checksums

The following code example shows how to use checksums to work with an Amazon S3 object.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The code examples use a subset of the following imports.

```
import org.slf4j.Logger;
```

```
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.ChecksumAlgorithm;
import software.amazon.awssdk.services.s3.model.ChecksumMode;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.GetObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.FileInputStream;
import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.security.DigestInputStream;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.ArrayList;
import java.util.Base64;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
```

Specify a checksum algorithm for the `putObject` method when you [build the PutObjectRequest](#).

```
public void putObjectWithChecksum() {
    s3Client.putObject(b -> b
        .bucket(bucketName)
        .key(key)
        .checksumAlgorithm(ChecksumAlgorithm.CRC32),
        RequestBody.fromString("This is a test"));
```

```
}
```

Verify the checksum for the `getObject` method when you [build the `GetObjectRequest`](#).

```
public GetObjectResponse getObjectWithChecksum() {  
    return s3Client.getObject(b -> b  
        .bucket(bucketName)  
        .key(key)  
        .checksumMode(ChecksumMode.ENABLED))  
        .response();  
}
```

Pre-calculate a checksum for the `putObject` method when you [build the `PutObjectRequest`](#).

```
public void putObjectWithPrecalculatedChecksum(String filePath) {  
    String checksum = calculateChecksum(filePath, "SHA-256");  
  
    s3Client.putObject((b -> b  
        .bucket(bucketName)  
        .key(key)  
        .checksumSHA256(checksum)),  
        RequestBody.fromFile(Paths.get(filePath)));  
}
```

Use the [S3 Transfer Manager](#) on top of the [AWS CRT-based S3 client](#) to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

You can specify a checksum algorithm for the SDK to use. By default, the SDK uses the CRC32 algorithm.

```
public void multipartUploadWithChecksumTm(String filePath) {  
    S3TransferManager transferManager = S3TransferManager.create();  
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()  
        .putObjectRequest(b -> b  
            .bucket(bucketName)  
            .key(key)  
            .checksumAlgorithm(ChecksumAlgorithm.SHA1))  
        .source(Paths.get(filePath))
```

```

        .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
        transferManager.close();
    }

```

Use the [S3Client API](#) or (S3AsyncClient API) to perform a multipart upload. If you specify an additional checksum, you must specify the algorithm to use on the initiation of the upload. You must also specify the algorithm for each part request and provide the checksum calculated for each part after it is uploaded.

```

public void multipartUploadWithChecksumS3Client(String filePath) {
    ChecksumAlgorithm algorithm = ChecksumAlgorithm.CRC32;

    // Initiate the multipart upload.
    CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
        .bucket(bucketName)
        .key(key)
        .checksumAlgorithm(algorithm)); // Checksum specified on initiation.
    String uploadId = createMultipartUploadResponse.uploadId();

    // Upload the parts of the file.
    int partNumber = 1;
    List<CompletedPart> completedParts = new ArrayList<>();
    ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

    try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
        long fileSize = file.length();
        long position = 0;
        while (position < fileSize) {
            file.seek(position);
            long read = file.getChannel().read(bb);

            bb.flip(); // Swap position and limit before reading from the
buffer.

            UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                .bucket(bucketName)
                .key(key)
                .uploadId(uploadId)
                .checksumAlgorithm(algorithm) // Checksum specified on each
part.

```

```

        .partNumber(partNumber)
        .build();

    UploadPartResponse partResponse = s3Client.uploadPart(
        uploadPartRequest,
        RequestBody.fromByteBuffer(bb));

    CompletedPart part = CompletedPart.builder()
        .partNumber(partNumber)
        .checksumCRC32(partResponse.checksumCRC32()) // Provide the
calculated checksum.
        .eTag(partResponse.eTag())
        .build();
    completedParts.add(part);

    bb.clear();
    position += read;
    partNumber++;
}
} catch (IOException e) {
    System.err.println(e.getMessage());
}

// Complete the multipart upload.
s3Client.completeMultipartUpload(b -> b
    .bucket(bucketName)
    .key(key)
    .uploadId(uploadId)

    .multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
}

```

Serverless examples

Invoke a Lambda function from an Amazon S3 trigger

The following code example shows how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Serverless examples](#) repository.

Consuming an S3 event with Lambda using Java.

Amazon S3 Control examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon S3 Control.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon S3 Control

The following code example shows how to get started using Amazon S3 Control.

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Learn core operations.

```
package com.example.s3.batch;  
  
import software.amazon.awssdk.services.s3.model.S3Exception;  
import java.io.IOException;  
import java.util.Map;  
import java.util.Scanner;  
import java.util.UUID;  
import java.util.concurrent.CompletionException;
```

```
public class S3BatchScenario {

    public static final String DASHES = new String(new char[80]).replace("\0", "-");
    private static final String STACK_NAME = "MyS3Stack";
    public static void main(String[] args) throws IOException {
        S3BatchActions actions = new S3BatchActions();
        String accountId = actions.getAccountId();
        String uuid = java.util.UUID.randomUUID().toString();
        Scanner scanner = new Scanner(System.in);

        System.out.println(DASHES);
        System.out.println("Welcome to the Amazon S3 Batch basics scenario.");
        System.out.println("""
            S3 Batch operations enables efficient and cost-effective processing of
large-scale
            data stored in Amazon S3. It automatically scales resources to handle
varying workloads
            without the need for manual intervention.

            One of the key features of S3 Batch is its ability to perform tagging
operations on objects stored in
            S3 buckets. Users can leverage S3 Batch to apply, update, or remove tags
on thousands or millions of
            objects in a single operation, streamlining the management and
organization of their data.

            This can be particularly useful for tasks such as cost allocation,
lifecycle management, or
            metadata-driven workflows, where consistent and accurate tagging is
essential.

            S3 Batch's scalability and serverless nature make it an ideal solution
for organizations with
            growing data volumes and complex data management requirements.

            This Java program walks you through Amazon S3 Batch operations.

            Let's get started...

priority");
        System.out.println("""
            In this step, we modify the job priority value. The higher the number,
the higher the priority.
            So, a job with a priority of `30` would have a higher priority than a
job with
            a priority of `20`. This is a common way to represent the priority of a
task
            or job, with higher numbers indicating a higher priority.

            Ensure that the job status allows for priority updates. Jobs in
certain
            states (e.g., Cancelled, Failed, or Completed) cannot have their
priorities
            updated. Only jobs in the Active or Suspended state typically allow
priority
            updates.

Actions

CreateJob

The following code example shows how to use CreateJob.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an asynchronous S3 job.

```
/**
 * Creates an asynchronous S3 job using the AWS Java SDK.
```

```

    *
    * @param accountId      the AWS account ID associated with the job
    * @param iamRoleArn     the ARN of the IAM role to be used for the job
    * @param manifestLocation the location of the job manifest file in S3
    * @param reportBucketName the name of the S3 bucket to store the job report
    * @param uuid           a unique identifier for the job
    * @return a CompletableFuture that represents the asynchronous creation of the
S3 job.
    *         The CompletableFuture will return the job ID if the job is created
successfully,
    *         or throw an exception if there is an error.
    */

S3 Directory Buckets examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with S3 Directory Buckets.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon S3 directory buckets

The following code example shows how to get started using Amazon S3 directory buckets.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package com.example.s3.directorybucket;

import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.Bucket;
import software.amazon.awssdk.services.s3.model.BucketInfo;
import software.amazon.awssdk.services.s3.model.BucketType;
import software.amazon.awssdk.services.s3.model.CreateBucketConfiguration;
```

```

import software.amazon.awssdk.services.s3.model.CreateBucketRequest;
import software.amazon.awssdk.services.s3.model.CreateBucketResponse;
import software.amazon.awssdk.services.s3.model.DataRedundancy;

/**
 * Before running this example:
 * <p>
 * The SDK must be able to authenticate AWS requests on your behalf. If you have
 * not configured
 * authentication for SDKs and tools, see
 * https://docs.aws.amazon.com/sdkref/latest/guide/access.html in the AWS SDKs
 * and Tools Reference Guide.
 * <p>
 * You must have a runtime environment configured with the Java SDK.
 * See
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html in
 * the Developer Guide if this is not set up.
 * <p>
 * To use S3 directory buckets, configure a gateway VPC endpoint. This is the
 * recommended method to enable directory bucket traffic without
 * requiring an internet gateway or NAT device. For more information on
 * configuring VPC gateway endpoints, visit
 * https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-networking.html#s3-express-networking-vpc-gateway.
 * <p>
 * Directory buckets are available in specific AWS Regions and Zones. For
 * details on Regions and Zones supporting directory buckets, see
 * https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-networking.html#s3-express-endpoints.
 */

 - [CreateBucket](#)
 - [ListDirectoryBuckets](#)

Topics

- [Basics](#)
- [Actions](#)
- [Scenarios](#)

Basics

Learn the basics

The following code example shows how to:

- Set up a VPC and VPC Endpoint.
- Set up the Policies, Roles, and User to work with S3 directory buckets and the S3 Express One Zone storage class.
- Create two S3 Clients.
- Create two buckets.
- Create an object and copy it over.
- Demonstrate performance difference.
- Populate the buckets to show the lexicographical difference.
- Prompt the user to see if they want to clean up the resources.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario demonstrating Amazon S3 features.

        It worked! This is because the S3Client that performed the copy
operation
        is the expressClient using the credentials for the user with permission
to
        work with directory buckets.

        It's important to remember the user permissions when interacting with
directory buckets. Instead of validating permissions on every call as
regular buckets do, directory buckets utilize the user credentials and
session
        token to validate. This allows for much faster connection speeds on
every call.
        For single calls, this is low, but for many concurrent calls
        this adds up to a lot of time saved.

S3 Glacier examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with S3 Glacier.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

SageMaker AI examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with SageMaker AI.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello SageMaker AI

The following code examples show how to get started using SageMaker AI.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 */
public class HelloSageMaker {
    public static void main(String[] args) {
        Region region = Region.US_WEST_2;
        SageMakerClient sageMakerClient = SageMakerClient.builder()
            .region(region)
            .build();

        listBooks(sageMakerClient);
        sageMakerClient.close();
    }

    public static void listBooks(SageMakerClient sageMakerClient) {
        try {
            ListNotebookInstancesResponse notebookInstancesResponse =
sageMakerClient.listNotebookInstances();
            List<NotebookInstanceSummary> items =
notebookInstancesResponse.notebookInstances();
            for (NotebookInstanceSummary item : items) {
                System.out.println("The notebook name is: " +
item.notebookInstanceName());
            }
        } catch (SageMakerException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

```
}  
}
```

Actions

CreatePipeline

The following code example shows how to use CreatePipeline.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Create a pipeline from the example pipeline JSON.  
public static void setupPipeline(SageMakerClient sageMakerClient, String  
filePath, String roleArn,  
    String functionArn, String pipelineName) {  
    System.out.println("Setting up the pipeline.");  
    JSONParser parser = new JSONParser();  
  
    // Read JSON and get pipeline definition.  
    try (FileReader reader = new FileReader(filePath)) {  
        Object obj = parser.parse(reader);  
        JSONObject jsonObject = (JSONObject) obj;  
        JSONArray stepsArray = (JSONArray) jsonObject.get("Steps");  
        for (Object stepObj : stepsArray) {  
            JSONObject step = (JSONObject) stepObj;  
            if (step.containsKey("FunctionArn")) {  
                step.put("FunctionArn", functionArn);  
            }  
        }  
    }  
}
```

```

        }
    }
    System.out.println(jsonObject);

    // Create the pipeline.
    CreatePipelineRequest pipelineRequest = CreatePipelineRequest.builder()
        .pipelineDescription("Java SDK example pipeline")
        .roleArn(roleArn)
        .pipelineName(pipelineName)
        .pipelineDefinition(jsonObject.toString())
        .build();

    sageMakerClient.createPipeline(pipelineRequest);

} catch (IamException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
} catch (IOException | ParseException e) {
    throw new RuntimeException(e);
}
}

```

- For API details, see [CreatePipeline](#) in *AWS SDK for Java 2.x API Reference*.

DeletePipeline

The following code example shows how to use DeletePipeline.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

// Delete a SageMaker pipeline by name.
public static void deletePipeline(SageMakerClient sageMakerClient, String
pipelineName) {
    DeletePipelineRequest pipelineRequest = DeletePipelineRequest.builder()
        .pipelineName(pipelineName)

```

```
        .build();

    sagemakerClient.deletePipeline(pipelineRequest);
    System.out.println("*** Successfully deleted " + pipelineName);
}
```

- For API details, see [DeletePipeline](#) in *AWS SDK for Java 2.x API Reference*.

DescribePipelineExecution

The following code example shows how to use `DescribePipelineExecution`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Check the status of a pipeline execution.
public static void waitForPipelineExecution(SageMakerClient sagemakerClient,
String executionArn)
    throws InterruptedException {
    String status;
    int index = 0;
    do {
        DescribePipelineExecutionRequest pipelineExecutionRequest =
DescribePipelineExecutionRequest.builder()
            .pipelineExecutionArn(executionArn)
            .build();

        DescribePipelineExecutionResponse response = sagemakerClient
            .describePipelineExecution(pipelineExecutionRequest);
        status = response.pipelineExecutionStatusAsString();
        System.out.println(index + ". The Status of the pipeline is " + status);
        TimeUnit.SECONDS.sleep(4);
        index++;
    } while ("Executing".equals(status));
    System.out.println("Pipeline finished with status " + status);
}
```

- For API details, see [DescribePipelineExecution](#) in *AWS SDK for Java 2.x API Reference*.

StartPipelineExecution

The following code example shows how to use StartPipelineExecution.

SDK for Java 2.x

Note

    }

```

- For API details, see [StartPipelineExecution](#) in *AWS SDK for Java 2.x API Reference*.

Scenarios

Get started with geospatial jobs and pipelines

The following code example shows how to:

- Set up resources for a pipeline.
- Set up a pipeline that executes a geospatial job.
- Start a pipeline execution.
- Monitor the status of the execution.

- View the output of the pipeline.
- Clean up resources.

For more information, see [Create and run SageMaker pipelines using AWS SDKs on Community.aws](#).

Secrets Manager examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Secrets Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Amazon SES examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Scenarios

Create a web application to track DynamoDB data

The following code example shows how to create a web application that tracks work items in an Amazon DynamoDB table and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB
- Amazon SES

Create a web application to track Amazon Redshift data

The following code example shows how to create a web application that tracks and reports on work items using an Amazon Redshift database.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on [GitHub](#).

Services used in this example

- Amazon Redshift
- Amazon SES

Create an Aurora Serverless work item tracker

The following code example shows how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on [GitHub](#).

Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Detect PPE in images

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB
- Amazon Rekognition

- Amazon S3
- Amazon SES

Detect objects in images

The following code example shows how to build an app that uses Amazon Rekognition to detect objects by category in images.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition

- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Use Step Functions to invoke Lambda functions

The following code example shows how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

Amazon SES API v2 examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SES API v2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Amazon SNS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon SNS

The following code examples show how to get started using Amazon SNS.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package com.example.sns;

import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.sns.SnsClient;
import software.amazon.awssdk.services.sns.model.SnsException;
import software.amazon.awssdk.services.sns.paginators.ListTopicsIterable;

public class HelloSNS {
    public static void main(String[] args) {
        SnsClient snsClient = SnsClient.builder()
            .region(Region.US_EAST_1)
            .build();

        listSNSTopics(snsClient);
        snsClient.close();
    }

    public static void listSNSTopics(SnsClient snsClient) {
        try {
            ListTopicsIterable listTopics = snsClient.listTopicsPaginator();
            listTopics.stream()
                .flatMap(r -> r.topics().stream())
                .forEach(content -> System.out.println(" Topic ARN: " +
content.topicArn()));

        } catch (SnsException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

- For API details, see [ListTopics](#) in *AWS SDK for Java 2.x API Reference*.

Scenarios

Build an app to submit data to a DynamoDB table

The following code example shows how to build an application that submits data to an Amazon DynamoDB table and notifies you when a user updates the table.

SDK for Java 2.x

Shows how to create a dynamic web application that submits data using the Amazon DynamoDB Java API and sends a text message using the Amazon Simple Notification Service Java API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB
- Amazon SNS

Building an Amazon SNS application

The following code example shows how to create an application that has subscription and publish functionality and translates messages.

SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on [GitHub](#).

Services used in this example

- Amazon SNS
- Amazon Translate

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

SDK for Java 2.x

```

Create a serverless application to manage photos

The following code example shows how to create a serverless application that lets users manage photos using labels.

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Create and publish to a FIFO topic

The following code example shows how to create and publish to a FIFO Amazon SNS topic.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example

- creates an Amazon SNS FIFO topic, two Amazon SQS FIFO queues, and one Standard queue.
- subscribes the queues to the topic and publishes a message to the topic.

The [test](#) verifies the receipt of the message to each queue. The [complete example](#) also shows the addition of access policies and deletes the resources at the end.

```
public class PriceUpdateExample {  
    public final static SnsClient snsClient = SnsClient.create();
```

```

public final static SqsClient sqsClient = SqsClient.create();

public static void main(String[] args) {

    final String usage = "\n" +
        "Usage: " +
        "    <topicName> <wholesaleQueueFifoName> <retailQueueFifoName>
<analyticsQueueName>\n\n" +
        "Where:\n" +
        "    fifoTopicName - The name of the FIFO topic that you want to create.
\n\n" +
        "    wholesaleQueueARN - The name of a SQS FIFO queue that will be
created for the wholesale consumer. \n\n"
        +
        "    retailQueueARN - The name of a SQS FIFO queue that will be created for
the retail consumer. \n\n" +
        "    analyticsQueueARN - The name of a SQS standard queue that will be
created for the analytics consumer. \n\n";
    if (args.length != 4) {

 - [Publish](#)
 - [Subscribe](#)

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Publish SMS messages to a topic

The following code example shows how to:

- Create an Amazon SNS topic.
- Subscribe phone numbers to the topic.
- Publish SMS messages to the topic so that all subscribed phone numbers receive the message at once.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a topic and return its ARN.

        }
    }
}

```

- For API details, see [Publish](#) in *AWS SDK for Java 2.x API Reference*.

Publish messages to queues

The following code example shows how to:

- Create topic (FIFO or non-FIFO).

- Subscribe several queues to the topic with an option to apply a filter.
- Publish messages to the topic.
- Poll the queues for messages received.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 * <p>
 * For more information, see the following documentation topic:
 * <p>
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 * <p>
 * This Java example performs these tasks:
 * <p>
 * 1. Gives the user three options to choose from.
 * 2. Creates an Amazon Simple Notification Service (Amazon SNS) topic.
 * 3. Creates an Amazon Simple Queue Service (Amazon SQS) queue.
 * 4. Gets the SQS queue Amazon Resource Name (ARN) attribute.
 * 5. Attaches an AWS Identity and Access Management (IAM) policy to the queue.
 * 6. Subscribes to the SQS queue.
 * 7. Publishes a message to the topic.
 * 8. Displays the messages.
 * 9. Deletes the received message.
 * 10. Unsubscribes from the topic.
 * 11. Deletes the SNS topic.

Use API Gateway to invoke a Lambda function

The following code example shows how to create an AWS Lambda function invoked by Amazon API Gateway.

SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

Use scheduled events to invoke a Lambda function

The following code example shows how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- CloudWatch Logs
- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

Serverless examples

Invoke a Lambda function from an Amazon SNS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SNS topic. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Serverless examples](#) repository.

Amazon SQS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon SQS

The following code examples show how to get started using Amazon SQS.

SDK for Java 2.x

```
SendMessageBatchRequest sendMessageBatchRequest =
SendMessageBatchRequest.builder()
    .queueUrl(queueUrl)

    .entries(SendMessageBatchRequestEntry.builder().id("id1").messageBody("Hello from
msg 1").build(),

SendMessageBatchRequestEntry.builder().id("id2").messageBody("msg
2").delaySeconds(10)
        .build())
    .build();
sqsClient.sendMessageBatch(sendMessageBatchRequest);
```

- For API details, see [SendMessageBatch](#) in *AWS SDK for Java 2.x API Reference*.

SetQueueAttributes

The following code example shows how to use `SetQueueAttributes`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Configure an Amazon SQS to use server-side encryption (SSE) using a custom KMS key.

```
public static void addEncryption(String queueName, String kmsMasterKeyAlias) {
    SqsClient sqsClient = SqsClient.create();

    GetQueueUrlRequest urlRequest = GetQueueUrlRequest.builder()
        .queueName(queueName)
        .build();

    GetQueueUrlResponse getQueueUrlResponse;
    try {
        getQueueUrlResponse = sqsClient.getQueueUrl(urlRequest);
    } catch (QueueDoesNotExistException e) {
        LOGGER.error(e.getMessage(), e);
        throw new RuntimeException(e);
    }
    String queueUrl = getQueueUrlResponse.queueUrl();

    Map<QueueAttributeName, String> attributes = Map.of(
        QueueAttributeName.KMS_MASTER_KEY_ID, kmsMasterKeyAlias,
        QueueAttributeName.KMS_DATA_KEY_REUSE_PERIOD_SECONDS, "140" // Set
the data key reuse period to 140 seconds.
    );
                                                                    // This
is how long SQS can reuse the data key before requesting a new one from KMS.

    SetQueueAttributesRequest attRequest = SetQueueAttributesRequest.builder()
        .queueUrl(queueUrl)
        .attributes(attributes)
        .build();

    try {
        sqsClient.setQueueAttributes(attRequest);
        LOGGER.info("The attributes have been applied to {}", queueName);
    } catch (InvalidAttributeNameException | InvalidAttributeValueException e) {
        LOGGER.error(e.getMessage(), e);
    }
}
```

```
        throw new RuntimeException(e);
    } finally {
        sqsClient.close();
    }
}
```

- For API details, see [SetQueueAttributes](#) in *AWS SDK for Java 2.x API Reference*.

Scenarios

Create a messaging application

The following code example shows how to create a messaging application by using Amazon SQS.

SDK for Java 2.x

Shows how to use the Amazon SQS API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Comprehend
- Amazon SQS

Create and publish to a FIFO topic

The following code example shows how to create and publish to a FIFO Amazon SNS topic.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example

- creates an Amazon SNS FIFO topic, two Amazon SQS FIFO queues, and one Standard queue.
- subscribes the queues to the topic and publishes a message to the topic.

The [test](#) verifies the receipt of the message to each queue. The [complete example](#) also shows the addition of access policies and deletes the resources at the end.

```
public class PriceUpdateExample {
    public final static SnsClient snsClient = SnsClient.create();
    public final static SqsClient sqsClient = SqsClient.create();

    public static void main(String[] args) {

        final String usage = "\n" +
            "Usage: " +
            "    <topicName> <wholesaleQueueFifoName> <retailQueueFifoName>
<analyticsQueueName>\n\n" +
            "Where:\n" +
            "    fifoTopicName - The name of the FIFO topic that you want to create.
\n\n" +
            "    wholesaleQueueARN - The name of a SQS FIFO queue that will be
created for the wholesale consumer. \n\n"
            +
            "    retailQueueARN - The name of a SQS FIFO queue that will created for
the retail consumer. \n\n" +
            "    analyticsQueueARN - The name of a SQS standard queue that will be
created for the analytics consumer. \n\n";
        if (args.length != 4) {
            System.out.println(usage);
            System.exit(1);
        }

        final String fifoTopicName = args[0];
        final String wholeSaleQueueName = args[1];
        final String retailQueueName = args[2];
        final String analyticsQueueName = args[3];

        // For convenience, the QueueData class holds metadata about a queue: ARN,
URL,
        // name and type.
        List<QueueData> queues = List.of(
            new QueueData(wholeSaleQueueName, QueueType.FIFO),
            new QueueData(retailQueueName, QueueType.FIFO),
            new QueueData(analyticsQueueName, QueueType.Standard));
    }
}
```

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Rekognition

- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Manage large messages using S3

The following code example shows how to use the Amazon SQS Extended Client Library to work with large Amazon SQS messages.

SDK for Java 2.x

Process S3 event notifications

The following code example shows how to work with S3 event notifications in an object-oriented way.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example show how to process S3 notification event by using Amazon SQS.

```
/**
 * This method receives S3 event notifications by using an SqsAsyncClient.
 * After the client receives the messages it deserializes the JSON payload and
 * logs them. It uses
 * the S3EventNotification class (part of the S3 event notification API for
 * Java) to deserialize
 * the JSON payload and access the messages in an object-oriented way.
 *
 * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
 * notifications.
 * @see <a href="https://sdk.amazonaws.com/java/api/latest/software/amazon/
 * awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification API</
 * a>.
 *
 * <p>
 * To use S3 event notification serialization/deserialization to objects, add
 * the following
 * dependency to your Maven pom.xml file.
 * <dependency>
 * <groupId>software.amazon.awssdk</groupId>
 * <artifactId>s3-event-notifications</artifactId>
 * <version><LATEST></version>
 * </dependency>
 * <p>
 * The S3 event notification API became available with version 2.25.11 of the
 * Java SDK.
 * <p>
 * This example shows the use of the API with AWS SQS, but it can be used to
 * process S3 event notifications
 * in AWS SNS or AWS Lambda as well.
 * <p>
 * Note: The S3EventNotification class does not work with messages routed
 * through AWS EventBridge.
 */
```

```

static void processS3Events(String bucketName, String queueUrl, String queueArn)

Publish messages to queues

The following code example shows how to:

- Create topic (FIFO or non-FIFO).
- Subscribe several queues to the topic with an option to apply a filter.
- Publish messages to the topic.
- Poll the queues for messages received.

Use the Amazon SQS Java Messaging Library to work with the JMS interface

The following code example shows how to use the Amazon SQS Java Messaging Library to work with the JMS interface.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The following examples work with standard Amazon SQS queues and include:

- Sending a text message.
- Receiving messages synchronously.
- Receiving messages asynchronously.
- Receiving messages using CLIENT_ACKNOWLEDGE mode.
- Receiving messages using the UNORDERED_ACKNOWLEDGE mode.
- Using Spring to inject dependencies.
- A utility class that provides common methods used by the other examples.

For more information on using JMS with Amazon SQS, see the [Amazon SQS Developer Guide](#).

Sending a text message.

```
/**
 * This method establishes a connection to a standard Amazon SQS queue using the
 * Amazon SQS
 * Java Messaging Library and sends text messages to it. It uses JMS (Java
 * Message Service) API
 * with automatic acknowledgment mode to ensure reliable message delivery, and
 * automatically
 * manages all messaging resources.
 *
 * @throws JMSException If there is a problem connecting to or sending messages
 * to the queue
 */
public static void doSendTextMessage() throws JMSException {
    // Create a connection factory.
    SQSConnectionFactory connectionFactory = new SQSConnectionFactory(
        new ProviderConfiguration(),
        SqsClient.create()
    );
}
```

```

        // Create the connection in a try-with-resources statement so that it's
        closed automatically.
        try (SQSConnection connection = connectionFactory.createConnection()) {

            // Create the queue if needed.
            SqsJmsExampleUtils.ensureQueueExists(connection, QUEUE_NAME,
            SqsJmsExampleUtils.QUEUE_VISIBILITY_TIMEOUT);

            // Create a session that uses the JMS auto-acknowledge mode.
            Session session = connection.createSession(false,
            Session.AUTO_ACKNOWLEDGE);
            MessageProducer producer =
            session.createProducer(session.createQueue(QUEUE_NAME));

            createAndSendMessages(session, producer);
        } // The connection closes automatically. This also closes the session.
        LOGGER.info("Connection closed");
    }

Serverless examples

Invoke a Lambda function from an Amazon SQS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SQS queue. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Serverless examples](#) repository.

Consuming an SQS event with Lambda using Java.

```

import com.amazonaws.services.lambda.runtime.events.SQSEvent.SQSMessage;

public class Function implements RequestHandler<SQSEvent, Void> {
    @Override
    public Void handleRequest(SQSEvent sqsEvent, Context context) {
        for (SQSMessage msg : sqsEvent.getRecords()) {
            processMessage(msg, context);
        }
        context.getLogger().log("done");
        return null;
    }

    private void processMessage(SQSMessage msg, Context context) {
        try {
            context.getLogger().log("Processed message " + msg.getBody());

            // TODO: Do interesting work based on the new message

        } catch (Exception e) {
            context.getLogger().log("An error occurred");
            throw e;
        }
    }
}
```

Reporting batch item failures for Lambda functions with an Amazon SQS trigger

The following code example shows how to implement partial batch response for Lambda functions that receive events from an SQS queue. The function reports the batch item failures in the response, signaling to Lambda to retry those messages later.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Serverless examples](#) repository.

Reporting SQS batch item failures with Lambda using Java.

                //process your message
            } catch (Exception e) {
                //Add failed message identifier to the batchItemFailures list
                batchItemFailures.add(new
                SQSBatchResponse.BatchItemFailure(message.getMessageId()));
            }
        }
    }
}
```

```
    }  
    return new SQSBatchResponse(batchItemFailures);  
  }  
}
```

Step Functions examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Step Functions.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Step Functions

The following code examples show how to get started using Step Functions.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Java version of Hello.

```
import software.amazon.awssdk.regions.Region;  
import software.amazon.awssdk.services.sfn.SfnClient;
```

```

import software.amazon.awssdk.services.sfn.model.ListStateMachinesResponse;
import software.amazon.awssdk.services.sfn.model.SfnException;
import software.amazon.awssdk.services.sfn.model.StateMachineListItem;
import java.util.List;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *

Topics

- [Basics](#)
- [Actions](#)
- [Scenarios](#)

Basics

Learn the basics

The following code example shows how to:

- Create an activity.
- Create a state machine from an Amazon States Language definition that contains the previously created activity as a step.
- Run the state machine and respond to the activity with user input.
- Get the final status and output after the run completes, then clean up resources.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * You can obtain the JSON file to create a state machine in the following
 * GitHub location.
 * <p>
 * https://github.com/awsdocs/aws-doc-sdk-examples/tree/main/resources/sample_files
 * <p>
 * To run this code example, place the chat_sfn_state_machine.json file into
 * your project's resources folder.
 * <p>
 * Also, set up your development environment, including your credentials.
 * <p>
 * For information, see this documentation topic:
```

```

* <p>
* https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
* <p>
* This Java code example performs the following tasks:
* <p>
* 1. Creates an activity.
* 2. Creates a state machine.
* 3. Describes the state machine.
* 4. Starts execution of the state machine and interacts with it.
* 5. Describes the execution.
* 6. Delete the activity.
* 7. Deletes the state machine.

Actions

CreateActivity

The following code example shows how to use CreateActivity.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createActivity(SfnClient sfnClient, String activityName) {
    try {
        CreateActivityRequest activityRequest = CreateActivityRequest.builder()
            .name(activityName)
            .build();

        CreateActivityResponse response =
sfnClient.createActivity(activityRequest);
        return response.activityArn();

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateActivity](#) in *AWS SDK for Java 2.x API Reference*.

CreateStateMachine

The following code example shows how to use CreateStateMachine.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createMachine(SfnClient sfnClient, String roleARN, String
stateMachineName, String json) {
    try {
        CreateStateMachineRequest machineRequest =
        CreateStateMachineRequest.builder()
            .definition(json)
            .name(stateMachineName)
            .roleArn(roleARN)
            .type(StateMachineType.STANDARD)
            .build();

        CreateStateMachineResponse response =
        sfnClient.createStateMachine(machineRequest);
        return response.stateMachineArn();

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

The following code example shows how to use SendTaskSuccess.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void sendTaskSuccess(SfnClient sfnClient, String token, String
json) {
    try {
        SendTaskSuccessRequest successRequest = SendTaskSuccessRequest.builder()
            .taskToken(token)
            .output(json)
            .build();

        sfnClient.sendTaskSuccess(successRequest);

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [SendTaskSuccess](#) in *AWS SDK for Java 2.x API Reference*.

StartExecution

The following code example shows how to use StartExecution.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String startWorkflow(SfnClient sfnClient, String stateMachineArn,
String jsonEx) {
    UUID uuid = UUID.randomUUID();
    String uuidValue = uuid.toString();
    try {
        StartExecutionRequest executionRequest = StartExecutionRequest.builder()
            .input(jsonEx)
            .stateMachineArn(stateMachineArn)
            .name(uuidValue)
            .build();

        StartExecutionResponse response =
sfnClient.startExecution(executionRequest);
        return response.executionArn();

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [StartExecution](#) in *AWS SDK for Java 2.x API Reference*.

Scenarios

Use Step Functions to invoke Lambda functions

The following code example shows how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- DynamoDB

- Lambda
- Amazon SES
- Step Functions

AWS STS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Support examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Support.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Support

The following code examples show how to get started using Support.

SDK for Java 2.x

Note

```
import software.amazon.awssdk.regions.Region;  
import software.amazon.awssdk.services.support.SupportClient;  
import software.amazon.awssdk.services.support.model.Category;  
import software.amazon.awssdk.services.support.model.DescribeServicesRequest;
```

```

import software.amazon.awssdk.services.support.model.DescribeServicesResponse;
import software.amazon.awssdk.services.support.model.Service;
import software.amazon.awssdk.services.support.model.SupportException;
import java.util.ArrayList;
import java.util.List;

/**
 * Before running this Java (v2) code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * In addition, you must have the AWS Business Support Plan to use the AWS
 * Support Java API. For more information, see:
 *
 * https://aws.amazon.com/premiumsupport/plans/
 *
 * This Java example performs the following task:
 *
 * 1. Gets and displays available services.
 *
 * NOTE: To see multiple operations, see SupportScenario.
 */

public class HelloSupport {
    public static void main(String[] args) {
        Region region = Region.US_WEST_2;
        SupportClient supportClient = SupportClient.builder()
            .region(region)
            .build();

        System.out.println("***** Step 1. Get and display available services.");
        displayServices(supportClient);
    }

    // Return a List that contains a Service name and Category name.
    public static void displayServices(SupportClient supportClient) {
        try {
            DescribeServicesRequest servicesRequest =
DescribeServicesRequest.builder()
                .language("en")

```

```
        .build();

        DescribeServicesResponse response =
supportClient.describeServices(servicesRequest);
        List<Service> services = response.services();

        System.out.println("Get the first 10 services");

            for (Category cat : categories) {
                System.out.println("The category name is: " + cat.name());
            }
            index++;
        }

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Java 2.x API Reference*.

Topics

- [Basics](#)
- [Actions](#)

Basics

Learn the basics

The following code example shows how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

SDK for Java 2.x

Note

Actions

AddAttachmentsToSet

The following code example shows how to use AddAttachmentsToSet.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String addAttachment(SupportClient supportClient, String
fileAttachment) {
    try {
        File myFile = new File(fileAttachment);
        InputStream sourceStream = new FileInputStream(myFile);
        SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);

        Attachment attachment = Attachment.builder()
            .fileName(myFile.getName())
            .data(sourceBytes)
            .build();

        AddAttachmentsToSetRequest setRequest =
AddAttachmentsToSetRequest.builder()
            .attachments(attachment)
            .build();

        AddAttachmentsToSetResponse response =
supportClient.addAttachmentsToSet(setRequest);
        return response.attachmentSetId();

    } catch (SupportException | FileNotFoundException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [AddAttachmentsToSet](#) in *AWS SDK for Java 2.x API Reference*.

AddCommunicationToCase

The following code example shows how to use `AddCommunicationToCase`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void addAttachSupportCase(SupportClient supportClient, String
caseId, String attachmentSetId) {
    try {
        AddCommunicationToCaseRequest caseRequest =
AddCommunicationToCaseRequest.builder()
            .caseId(caseId)
            .attachmentSetId(attachmentSetId)
            .communicationBody("Please refer to attachment for details.")
            .build();

        AddCommunicationToCaseResponse response =
supportClient.addCommunicationToCase(caseRequest);
        if (response.result())
            System.out.println("You have successfully added a communication to
an AWS Support case");
        else
            System.out.println("There was an error adding the communication to
an AWS Support case");

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [AddCommunicationToCase](#) in *AWS SDK for Java 2.x API Reference*.

CreateCase

The following code example shows how to use CreateCase.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createSupportCase(SupportClient supportClient, List<String>
sevCatList, String sevLevel) {
    try {
        String serviceCode = sevCatList.get(0);
        String caseCat = sevCatList.get(1);
        CreateCaseRequest caseRequest = CreateCaseRequest.builder()
            .categoryCode(caseCat.toLowerCase())
            .serviceCode(serviceCode.toLowerCase())
            .severityCode(sevLevel.toLowerCase())
            .communicationBody("Test issue with " +
serviceCode.toLowerCase())
            .subject("Test case, please ignore")
            .language("en")
            .issueType("technical")
            .build();

        CreateCaseResponse response = supportClient.createCase(caseRequest);
        return response.caseId();

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateCase](#) in *AWS SDK for Java 2.x API Reference*.

DescribeAttachment

The following code example shows how to use DescribeAttachment.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeAttachment(SupportClient supportClient, String
attachId) {
    try {
        DescribeAttachmentRequest attachmentRequest =
DescribeAttachmentRequest.builder()
            .attachmentId(attachId)
            .build();

        DescribeAttachmentResponse response =
supportClient.describeAttachment(attachmentRequest);
        System.out.println("The name of the file is " +
response.attachment().fileName());

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeAttachment](#) in *AWS SDK for Java 2.x API Reference*.

DescribeCases

The following code example shows how to use DescribeCases.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getOpenCase(SupportClient supportClient) {
    try {
        // Specify the start and end time.
        Instant now = Instant.now();
        java.time.LocalDate.now();
        Instant yesterday = now.minus(1, ChronoUnit.DAYS);

        DescribeCasesRequest describeCasesRequest =
        DescribeCasesRequest.builder()
            .maxResults(20)
            .afterTime(yesterday.toString())
            .beforeTime(now.toString())
            .build();

        DescribeCasesResponse response =
        supportClient.describeCases(describeCasesRequest);
        List<CaseDetails> cases = response.cases();
        for (CaseDetails sinCase : cases) {
            System.out.println("The case status is " + sinCase.status());
            System.out.println("The case Id is " + sinCase.caseId());
            System.out.println("The case subject is " + sinCase.subject());
        }

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeCases](#) in *AWS SDK for Java 2.x API Reference*.

DescribeCommunications

The following code example shows how to use DescribeCommunications.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String listCommunications(SupportClient supportClient, String
caseId) {
    try {
        String attachId = null;
        DescribeCommunicationsRequest communicationsRequest =
DescribeCommunicationsRequest.builder()
                                .caseId(caseId)
                                .maxResults(10)
                                .build();

        DescribeCommunicationsResponse response =
supportClient.describeCommunications(communicationsRequest);
        List<Communication> communications = response.communications();
        for (Communication comm : communications) {
            System.out.println("the body is: " + comm.body());

            // Get the attachment id value.
            List<AttachmentDetails> attachments = comm.attachmentSet();
            for (AttachmentDetails detail : attachments) {
                attachId = detail.attachmentId();
            }
        }
        return attachId;

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [DescribeCommunications](#) in *AWS SDK for Java 2.x API Reference*.

DescribeServices

The following code example shows how to use DescribeServices.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Return a List that contains a Service name and Category name.
public static List<String> displayServices(SupportClient supportClient) {
    try {
        DescribeServicesRequest servicesRequest =
DescribeServicesRequest.builder()
                        .language("en")
                        .build();

        DescribeServicesResponse response =
supportClient.describeServices(servicesRequest);
        String serviceCode = null;
        String catName = null;
        List<String> sevCatList = new ArrayList<>();
        List<Service> services = response.services();

        System.out.println("Get the first 10 services");
        int index = 1;
        for (Service service : services) {
            if (index == 11)
                break;

            System.out.println("The Service name is: " + service.name());
            if (service.name().compareTo("Account") == 0)
                serviceCode = service.code();

            // Get the Categories for this service.
```

```
        List<Category> categories = service.categories();
        for (Category cat : categories) {
            System.out.println("The category name is: " + cat.name());
            if (cat.name().compareTo("Security") == 0)
                catName = cat.name();
        }
        index++;
    }

    // Push the two values to the list.
    sevCatList.add(serviceCode);
    sevCatList.add(catName);
    return sevCatList;

} catch (SupportException e) {
    System.out.println(e.getLocalizedMessage());
    System.exit(1);
}
return null;
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Java 2.x API Reference*.

DescribeSeverityLevels

The following code example shows how to use `DescribeSeverityLevels`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String displaySevLevels(SupportClient supportClient) {
    try {
        DescribeSeverityLevelsRequest severityLevelsRequest =
        DescribeSeverityLevelsRequest.builder()
            .language("en")
            .build();
```

```
DescribeSeverityLevelsResponse response =
supportClient.describeSeverityLevels(severityLevelsRequest);
List<SeverityLevel> severityLevels = response.severityLevels();
String levelName = null;
for (SeverityLevel sevLevel : severityLevels) {
    System.out.println("The severity level name is: " +
sevLevel.name());
    if (sevLevel.name().compareTo("High") == 0)
        levelName = sevLevel.name();
}
return levelName;

} catch (SupportException e) {
    System.out.println(e.getLocalizedMessage());
    System.exit(1);
}
return "";
}
```

- For API details, see [DescribeSeverityLevels](#) in *AWS SDK for Java 2.x API Reference*.

ResolveCase

The following code example shows how to use `ResolveCase`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void resolveSupportCase(SupportClient supportClient, String
caseId) {
    try {
        ResolveCaseRequest caseRequest = ResolveCaseRequest.builder()
            .caseId(caseId)
            .build();
```

```
        ResolveCaseResponse response = supportClient.resolveCase(caseRequest);
        System.out.println("The status of case " + caseId + " is " +
            response.finalCaseStatus());

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [ResolveCase](#) in *AWS SDK for Java 2.x API Reference*.

Systems Manager examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Systems Manager.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Systems Manager

The following code examples show how to get started using Systems Manager.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import software.amazon.awssdk.regions.Region;
```

```

import software.amazon.awssdk.services.ssm.SsmClient;
import software.amazon.awssdk.services.ssm.model.DocumentFilter;
import software.amazon.awssdk.services.ssm.model.ListDocumentsRequest;
import software.amazon.awssdk.services.ssm.model.ListDocumentsResponse;

public class HelloSSM {

    public static void main(String[] args) {
        final String usage = ""

            Usage:
                <awsAccount>

            Where:
                awsAccount - Your AWS Account number.
            "";

        if (args.length != 1) {
            System.out.println(usage);
            System.exit(1);
        }

        String awsAccount = args[0] ;
        Region region = Region.US_EAST_1;
        SsmClient ssmClient = SsmClient.builder()
            .region(region)
            .build();

        listDocuments(ssmClient, awsAccount);
    }

    /*
    This code automatically fetches the next set of results using the `nextToken`
    and
    stops once the desired maxResults (20 in this case) have been reached.
    */
    public static void listDocuments(SsmClient ssmClient, String awsAccount) {
        String nextToken = null;
        int totalDocumentsReturned = 0;
        int maxResults = 20;
        do {
            ListDocumentsRequest request = ListDocumentsRequest.builder()
                .documentFilterList(
                    DocumentFilter.builder()

```

```
                .key("Owner")
                .value(awsAccount)
                .build()
            )
            .maxResults(maxResults)
            .nextToken(nextToken)
            .build();

    ListDocumentsResponse response = ssmClient.listDocuments(request);
    response.documentIdentifiers().forEach(identifier ->
    System.out.println("Document Name: " + identifier.name()));
    nextToken = response.nextToken();
    totalDocumentsReturned += response.documentIdentifiers().size();
    } while (nextToken != null && totalDocumentsReturned < maxResults);
    }
}
```

- For API details, see [ListDocuments](#) in *AWS SDK for Java 2.x API Reference*.

Topics

- [Basics](#)
- [Actions](#)

Basics

Learn the basics

The following code example shows how to:

- Create a maintenance window.
- Modify the maintenance window schedule.
- Create a document.
- Send a command to a specified EC2 instance.
- Create an OpsItem.
- Update and resolve the OpsItem.
- Delete the maintenance window, OpsItem, and document.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import software.amazon.awssdk.services.ssm.model.DocumentAlreadyExistsException;
import software.amazon.awssdk.services.ssm.model.SsmException;

import java.util.Scanner;
public class SSMScenario {
    public static final String DASHES = new String(new char[80]).replace("\0", "-");

    public static void main(String[] args) {
        String usage = ""
            Usage:
                <instanceId> <title> <source> <category> <severity>

        Where:
            instanceId - The Amazon EC2 Linux/UNIX instance Id that AWS Systems
Manager uses (ie, i-0149338494ed95f06).
            title - The title of the parameter (default is Disk Space Alert).
            source - The source of the parameter (default is EC2).
            category - The category of the parameter. Valid values are
'Availability', 'Cost', 'Performance', 'Recovery', 'Security' (default is
Performance).
            severity - The severity of the parameter. Severity should be a
number from 1 to 4 (default is 2).
        """;

            6. Now we will create an SSM OpsItem.
            A SSM OpsItem is a feature provided by Amazon's Systems Manager (SSM)
service.

            It is a type of operational data item that allows you to manage and
track various operational issues,
            events, or tasks within your AWS environment.

```

You can create OpsItems to track and manage operational issues as they arise.

For example, you could create an OpsItem whenever your application detects a critical error

or an anomaly in your infrastructure.

```

Amazon Textract examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Java 2.x

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various

languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the AWS CDK. For source code and deployment instructions, see the project in [GitHub](#).

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Amazon Transcribe examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

ListTranscriptionJobs

The following code example shows how to use `ListTranscriptionJobs`.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public class ListTranscriptionJobs {
    public static void main(String[] args) {
        TranscribeClient transcribeClient = TranscribeClient.builder()
            .region(Region.US_EAST_1)
            .build();

        listTranscriptionJobs(transcribeClient);
    }

    public static void listTranscriptionJobs(TranscribeClient transcribeClient)
    {
        ListTranscriptionJobsRequest listJobsRequest =
        ListTranscriptionJobsRequest.builder()
            .build();

        transcribeClient.listTranscriptionJobsPaginator(listJobsRequest).stream()
            .flatMap(response -> response.transcriptionJobSummaries().stream())
            .forEach(jobSummary -> {
                System.out.println("Job Name: " +
                jobSummary.transcriptionJobName());
                System.out.println("Job Status: " +
                jobSummary.transcriptionJobStatus());
                System.out.println("Output Location: " +
                jobSummary.outputLocationType());
                // Add more information as needed

                // Retrieve additional details for the job if necessary
            });
    }
}
```

```
        GetTranscriptionJobResponse jobDetails =
transcribeClient.getTranscriptionJob(
    GetTranscriptionJobRequest.builder()
        .transcriptionJobName(jobSummary.transcriptionJobName())
        .build());

        // Display additional details
        System.out.println("Language Code: " +
jobDetails.transcriptionJob().languageCode());
        System.out.println("Media Format: " +
jobDetails.transcriptionJob().mediaFormat());
        // Add more details as needed

        System.out.println("-----");
    });
}
```

Amazon Transcribe Streaming examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Transcribe Streaming.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Transcribe audio from a microphone

The following code example shows how to generate a transcription from a microphone using Amazon Transcribe streaming.

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public class TranscribeStreamingDemoApp {
    private static final Region REGION = Region.US_EAST_1;
    private static TranscribeStreamingAsyncClient client;

    public static void main(String[] args)
        throws URISyntaxException, ExecutionException, InterruptedException,
        LineUnavailableException {

        client = TranscribeStreamingAsyncClient.builder()
            .credentialsProvider(getCredentials())
            .region(REGION)
            .build();

        CompletableFuture<Void> result =
client.startStreamTranscription(getRequest(16_000),
    new AudioStreamPublisher(getStreamFromMic()),
    getResponseHandler());

        result.get();
        client.close();
    }

    private static InputStream getStreamFromMic() throws LineUnavailableException {

        // Signed PCM AudioFormat with 16kHz, 16 bit sample size, mono
    }
}
```

```

        int sampleRate = 16000;
        AudioFormat format = new AudioFormat(sampleRate, 16, 1, true, false);
        DataLine.Info info = new DataLine.Info(TargetDataLine.class, format);

        if (!AudioSystem.isLineSupported(info)) {
            System.out.println("Line not supported");
            System.exit(0);
        }

        TargetDataLine line = (TargetDataLine) AudioSystem.getLine(info);
        line.open(format);
        line.start();

        InputStream audioStream = new AudioInputStream(line);
        return audioStream;
    }

    private static AwsCredentialsProvider getCredentials() {
        return DefaultCredentialsProvider.create();
    }

    private static StartStreamTranscriptionRequest getRequest(Integer
mediaSampleRateHertz) {
        return StartStreamTranscriptionRequest.builder()
            .languageCode(LanguageCode.EN_US.toString())
            .mediaEncoding(MediaEncoding.PCM)
            .mediaSampleRateHertz(mediaSampleRateHertz)
            .build();
    }

    private static StartStreamTranscriptionResponseHandler getResponseHandler() {
        return StartStreamTranscriptionResponseHandler.builder()
            .onResponse(r -> {
                System.out.println("Received Initial response");
            })
            .onError(e -> {
                System.out.println(e.getMessage());
                StringWriter sw = new StringWriter();
                e.printStackTrace(new PrintWriter(sw));
                System.out.println("Error Occurred: " + sw);
            })
            .onComplete(() -> {
                System.out.println("=== All records stream successfully ===");
            })
    }

```

```

        .subscriber(event -> {
            List<Result> results = ((TranscriptEvent)
event).transcript().results();
            if (results.size() > 0) {
                if (!
results.get(0).alternatives().get(0).transcript().isEmpty()) {

System.out.println(results.get(0).alternatives().get(0).transcript());

                }
            }
        })
        .build();
    }

private static class AudioStreamPublisher implements Publisher<AudioStream> {
    private static Subscription currentSubscription;
    private final InputStream inputStream;

    private AudioStreamPublisher(InputStream inputStream) {
        this.inputStream = inputStream;
    }

    @Override
    public void subscribe(Subscriber<? super AudioStream> s) {

        if (currentSubscription == null) {
            currentSubscription = new SubscriptionImpl(s, inputStream);
        } else {
            currentSubscription.cancel();
            currentSubscription = new SubscriptionImpl(s, inputStream);
        }
        s.onSubscribe(currentSubscription);
    }
}

public static class SubscriptionImpl implements Subscription {
    private static final int CHUNK_SIZE_IN_BYTES = 1024;
    private final Subscriber<? super AudioStream> subscriber;
    private final InputStream inputStream;
    private final ExecutorService executor = Executors.newFixedThreadPool(1);
    private final AtomicLong demand = new AtomicLong(0);

```

```

SubscriptionImpl(Subscriber<? super AudioStream> s, InputStream inputStream)
{
    this.subscriber = s;
    this.inputStream = inputStream;
}

@Override
public void request(long n) {
    if (n <= 0) {
        subscriber.onError(new IllegalArgumentException("Demand must be
positive"));
    }

    demand.getAndAdd(n);

    executor.submit(() -> {
        try {
            do {
                ByteBuffer audioBuffer = getNextEvent();
                if (audioBuffer.remaining() > 0) {
                    AudioEvent audioEvent =
audioEventFromBuffer(audioBuffer);
                    subscriber.onNext(audioEvent);
                } else {
                    subscriber.onComplete();
                    break;
                }
            } while (demand.decrementAndGet() > 0);
        } catch (Exception e) {
            subscriber.onError(e);
        }
    });
}

@Override
public void cancel() {
    executor.shutdown();
}

private ByteBuffer getNextEvent() {
    ByteBuffer audioBuffer = null;
    byte[] audioBytes = new byte[CHUNK_SIZE_IN_BYTES];

    int len = 0;

```

```
        try {
            len = inputStream.read(audioBytes);

            if (len <= 0) {
                audioBuffer = ByteBuffer.allocate(0);
            } else {
                audioBuffer = ByteBuffer.wrap(audioBytes, 0, len);
            }
        } catch (IOException e) {
            throw new UncheckedIOException(e);
        }

        return audioBuffer;
    }

    private AudioEvent audioEventFromBuffer(ByteBuffer bb) {
        return AudioEvent.builder()
            .audioChunk(SdkBytes.fromByteBuffer(bb))
            .build();
    }
}
```

- For API details, see [StartStreamTranscription](#) in *AWS SDK for Java 2.x API Reference*.

Amazon Translate examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Translate.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- [Scenarios](#)

Scenarios

Building an Amazon Lex chatbot

The following code example shows how to create a chatbot to engage your website visitors.

SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

Building an Amazon SNS application

The following code example shows how to create an application that has subscription and publish functionality and translates messages.

SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on [GitHub](#).

Services used in this example

- Amazon SNS
- Amazon Translate

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Java 2.x

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the AWS CDK. For source code and deployment instructions, see the project in [GitHub](#).

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Security for the AWS SDK for Java

Cloud security at Amazon Web Services (AWS) is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations. Security is a shared responsibility between AWS and you. The [Shared Responsibility Model](#) describes this as Security of the Cloud and Security in the Cloud.

Security of the Cloud – AWS is responsible for protecting the infrastructure that runs all of the services offered in the AWS Cloud and providing you with services that you can use securely. Our security responsibility is the highest priority at AWS, and the effectiveness of our security is regularly tested and verified by third-party auditors as part of the [AWS Compliance Programs](#).

Security in the Cloud – Your responsibility is determined by the AWS service you are using, and other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Topics

- [Data protection in AWS SDK for Java 2.x](#)
- [Working with TLS in the SDK for Java](#)
- [Identity and Access Management](#)
- [Compliance Validation for this AWS Product or Service](#)
- [Resilience for this AWS Product or Service](#)
- [Infrastructure Security for this AWS Product or Service](#)

Data protection in AWS SDK for Java 2.x

The AWS [shared responsibility model](#) applies to data protection in AWS SDK for Java. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for

the AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the *AWS Security Blog*.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see [Working with CloudTrail trails](#) in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-3](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with SDK for Java or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Working with TLS in the SDK for Java

The AWS SDK for Java uses the TLS capabilities of its underlying Java platform. In this topic, we show examples using the OpenJDK implementation used by [Amazon Corretto 17](#).

To work with AWS services, the underlying JDK must support a minimum version of TLS 1.2, but TLS 1.3 is recommended.

Users should consult the documentation of the the Java platform they are using with the SDK to find out which TLS versions are enabled by default as well as how to enable and disable specific TLS versions.

How to check TLS version information

Using OpenJDK, the following code shows the use of [SSLContext](#) to print which TLS/SSL versions are supported.

```
System.out.println(Arrays.toString(SSLContext.getDefault().getSupportedSSLParameters().getProtocols()));
```

For example, Amazon Corretto 17 (OpenJDK) produces the following output.

```
[TLSv1.3, TLSv1.2, TLSv1.1, TLSv1, SSLv3, SSLv2Hello]
```

To see the SSL handshake in action and what version of TLS is used, you can use the system property **javax.net.debug**.

For example, run a Java applications that uses TLS.

```
java app.jar -Djavax.net.debug=ssl:handshake
```

The application logs the SSL handshake similar to the following.

```
...
javax.net.ssl|DEBUG|10|main|2022-12-23 13:53:12.221 EST|ClientHello.java:641|Produced
ClientHello handshake message (
"ClientHello": {
  "client version"      : "TLSv1.2",
  ...
javax.net.ssl|DEBUG|10|main|2022-12-23 13:53:12.295 EST|ServerHello.java:888|Consuming
ServerHello handshake message (
"ServerHello": {
  "server version"      : "TLSv1.2",
  ...
```

Enforce a minimum TLS version

The SDK for Java always prefers the latest TLS version supported by the platform and service. If you wish to enforce a specific minimum TLS version, consult your Java platform's documentation.

For OpenJDK-based JVMs, you can use the system property `jdk.tls.client.protocols`.

For example, if you want SDK service clients in your application to use TLS 1.2, even though TLS 1.3 is available, provide the following system property.

```
java app.jar -Djdk.tls.client.protocols=TLSv1.2
```

AWS API endpoints upgrade to TLS 1.2

See this [blog post](#) for information about AWS API endpoints moving to TLS 1.2 for the minimum version.

Identity and Access Management

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

Topics

- [Audience](#)
- [Authenticating with identities](#)
- [Managing access using policies](#)
- [How AWS services work with IAM](#)
- [Troubleshooting AWS identity and access](#)

Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

Service user – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see [Troubleshooting AWS identity and access](#) or the user guide of the AWS service you are using.

Service administrator – If you're in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

IAM administrator – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be *authenticated* (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see [How to sign in to your AWS account](#) in the *AWS Sign-In User Guide*.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see [AWS Signature Version 4 for API requests](#) in the *IAM User Guide*.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see [Multi-factor authentication](#) in the *AWS IAM Identity Center User Guide* and [AWS Multi-factor authentication in IAM](#) in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see [Tasks that require root user credentials](#) in the *IAM User Guide*.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A *federated identity* is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see [What is IAM Identity Center?](#) in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An [IAM user](#) is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see [Rotate access keys regularly for use cases that require long-term credentials](#) in the *IAM User Guide*.

An [IAM group](#) is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see [Use cases for IAM users](#) in the *IAM User Guide*.

IAM roles

An [IAM role](#) is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. To temporarily assume an IAM role in the AWS Management Console, you can [switch from a user to an IAM role \(console\)](#). You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see [Methods to assume a role](#) in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see [Create a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see [Permission sets](#) in the *AWS IAM Identity Center User Guide*.
- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the *IAM User Guide*.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
- **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the

principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see [Forward access sessions](#).

- **Service role** – A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Create a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.
- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see [Use an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see [Overview of JSON policies](#) in the *IAM User Guide*.

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Define custom IAM permissions with customer managed policies](#) in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choose between managed policies and inline policies](#) in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must [specify a principal](#) in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see [Access control list \(ACL\) overview](#) in the *Amazon Simple Storage Service Developer Guide*.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](#) in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see [Service control policies](#) in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – RCPs are JSON policies that you can use to set the maximum available permissions for resources in your accounts without updating the IAM policies attached to each resource that you own. The RCP limits permissions for resources in member accounts and can impact the effective permissions for identities, including the AWS account root user, regardless of whether they belong to your organization. For more information about Organizations and RCPs, including a list of AWS services that support RCPs, see [Resource control policies \(RCPs\)](#) in the *AWS Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see [Session policies](#) in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](#) in the *IAM User Guide*.

How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see [AWS services that work with IAM](#) in the *IAM User Guide*.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

Topics

- [I am not authorized to perform an action in AWS](#)
- [I am not authorized to perform iam:PassRole](#)
- [I want to allow people outside of my AWS account to access my AWS resources](#)

I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional `my-example-widget` resource but doesn't have the fictional `awes:GetWidget` permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
awes:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the `my-example-widget` resource by using the `awes:GetWidget` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my AWS resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see [How AWS services work with IAM](#).
- To learn how to provide access to your resources across AWS accounts that you own, see [Providing access to an IAM user in another AWS account that you own](#) in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see [Providing access to AWS accounts owned by third parties](#) in the *IAM User Guide*.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users \(identity federation\)](#) in the *IAM User Guide*.

- To learn the difference between using roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the *IAM User Guide*.

Compliance Validation for this AWS Product or Service

To learn whether an AWS service is within the scope of specific compliance programs, see [AWS services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security Compliance & Governance](#) – These solution implementation guides discuss architectural considerations and provide steps for deploying security and compliance features.
- [HIPAA Eligible Services Reference](#) – Lists HIPAA eligible services. Not all AWS services are HIPAA eligible.
- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [AWS Customer Compliance Guides](#) – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).
- [Amazon GuardDuty](#) – This AWS service detects potential threats to your AWS accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious

activities. GuardDuty can help you address various compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.

- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Resilience for this AWS Product or Service

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Infrastructure Security for this AWS Product or Service

This AWS product or service uses managed services, and therefore is protected by the AWS global network security. For information about AWS security services and how AWS protects infrastructure, see [AWS Cloud Security](#). To design your AWS environment using the best practices for infrastructure security, see [Infrastructure Protection](#) in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access this AWS Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Migrate from version 1.x to 2.x of the AWS SDK for Java

The AWS SDK for Java 2.x is a major rewrite of the 1.x code base built on top of Java 8+. It includes many updates, such as improved consistency, ease of use, and strongly enforced immutability. This section describes the major features that are new in version 2.x, and provides guidance on how to migrate your code to version 2.x from 1.x.

Topics

- [What's new in version 2](#)
- [How to migrate your code from AWS SDK for Java 1.x to 2.x](#)
- [What's different between the AWS SDK for Java 1.x and 2.x](#)
- [Use the SDK for Java 1.x and 2.x side-by-side](#)

What's new in version 2

- You can configure your own HTTP clients. See [HTTP transport configuration](#).
- Async clients feature non-blocking I/O support and return `CompletableFuture` objects. See [Asynchronous programming](#).
- Operations that return multiple pages have autopaginated responses. This way, you can focus your code on what to do with the response, without the need to check for and get subsequent pages. See [Pagination](#).
- SDK start time performance for AWS Lambda functions is improved. See [SDK start time performance improvements](#).
- Version 2.x supports a new shorthand method for creating requests.

Example

```
dynamoDbClient.putItem(request -> request.tableName(TABLE))
```

For more details about the new features and to see specific code examples, refer to the other sections of this guide.

- [Quick Start](#)
- [Setting up](#)

- [Code examples for the AWS SDK for Java 2.x](#)
- [Use the SDK](#)
- [Security for the AWS SDK for Java](#)

How to migrate your code from AWS SDK for Java 1.x to 2.x

You can migrate your existing SDK for Java 1.x applications in a couple ways.

1. Automated approach by using the [migration tool](#).
2. [Manual approach](#) by incrementally replacing 1.x imports with 2.x imports.

We recommend that you start by using the migration tool. It automates much of the routine, replacement work from 1.x to 2.x code.

Since the preview release of the tool [doesn't migrate all features](#), you'll need to search for remaining v1 code after running the tool. When you find code that the tool didn't migrate, follow the [step-by-step instructions](#) (manual approach) and use the [migration guide articles](#) to finish the migration.

Topics

- [Migration tool \(preview release\)](#)
- [Migration step-by-step instructions with example](#)

Migration tool (preview release)

The AWS SDK for Java provides a migration tool that helps automate the migration of SDK for Java 1.x code to 2.x. The tool uses [OpenRewrite](#)—an open source, source code refactoring tool—to perform the migration.

You can use the tool now as a preview release. The tool supports all SDK service clients except for [AmazonS3Client](#) and high-level APIs such as [TransferManager](#) and [DynamoDBMapper](#). The tool also has some limitations that are listed at the end of this topic.

Use the migration tool

Migrate a Maven project

Follow the instructions below to migrate your SDK for Java 1.x Maven-based project by using the [OpenRewrite Maven plugin](#) tool.

1. Navigate to your Maven project's root directory

Open a terminal (command line) window and navigate to the root directory of your Maven-based application.

2. Run the plugin's `rewrite-maven-plugin` command

You can choose from two modes (Maven goals): `dryRun` and `run`.

`dryRun` mode

In the `dryRun` mode, the plugin generates diff logs in the console output and a patch file named `rewrite.patch` in the `target/rewrite` folder. This mode allows you to preview the changes that would be made, since no changes are made to source code files.

The following example show how to invoke the plugin in `dryRun` mode.

```
mvn org.openrewrite.maven:rewrite-maven-plugin:<rewrite-plugin-version>*:dryRun \
  -Drewrite.recipeArtifactCoordinates=software.amazon.awssdk:v2-
migration:<sdkversion>**-PREVIEW \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

*Replace `<rewrite-plugin-version>` with the `rewriteMavenPluginVersion` value that you see in this [test file](#).

**Replace `<sdkversion>` with a 2.x SDK version. Visit [Maven Central](#) to check for the latest version.

Important

Be sure to use the version of the `rewrite-maven-plugin` shown in the [test file](#) because other versions may not work.

Your console output from the `dryRun` mode should resemble the following output.

```
[WARNING] These recipes would make changes to project/src/test/resources/maven/

[WARNING]                software.amazon.awssdk.v2migration.NewClassToBuilder
[WARNING]                software.amazon.awssdk.v2migration.V1SetterToV2
[WARNING]                software.amazon.awssdk.v2migration.HttpSettingsToHttpClient
[WARNING]                software.amazon.awssdk.v2migration.WrapSdkClientBuilderRegionStr
[WARNING] Patch file available:
[WARNING]                project/src/test/resources/maven/before/target/rewrite/rewrite.patch
[WARNING] Estimate time saved: 20m
[WARNING] Run 'mvn rewrite:run' to apply the recipes.
```

run mode

When you run the plugin in run mode, it modifies the source code on disk to apply the changes. Make sure you have a backup of the source code before running the command.

The following example show how to invoke the plugin in run mode.

```
mvn org.openrewrite.maven:rewrite-maven-plugin:<rewrite-plugin-version>*:run \
  -Drewrite.recipeArtifactCoordinates=software.amazon.awssdk:v2-
migration:<sdkversion>**-PREVIEW \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

*Replace **<rewrite-plugin-version>** with the `rewriteMavenPluginVersion` value that you see in this [test file](#).

**Replace `<sdkversion>` with a 2.x SDK version. Visit [Maven Central](#) to check for the latest version.

After you run the command, compile your application and run tests to verify the changes.

Migrate a Gradle project

Follow the instructions below to migrate your SDK for Java 1.x Gradle-based project by using the [OpenRewrite Gradle plugin](#) tool.

1. Navigate to your Gradle project's root directory

Open a terminal (command line) window and navigate to the root directory of your Gradle-based application.

2. Create a Gradle init script

Create a `init.gradle` file with the following content in the directory.

```
initScript {
    repositories {
        maven { url "https://plugins.gradle.org/m2" }
    }
    dependencies {
        classpath("org.openrewrite:plugin:<rewrite-plugin-version>")
    }
}

rootProject {
    plugins.apply(org.openrewrite.gradle.RewritePlugin)
    dependencies {
        rewrite("software.amazon.awssdk:v2-migration:latest.release")
    }

    afterEvaluate {
        if (repositories.isEmpty()) {
            repositories {
                mavenCentral()
            }
        }
    }
}
```

```
}
```

*Replace `<rewrite-plugin-version>` with the version that you see in this [test file](#).

3. Run the rewrite command

As with the Maven plugin, you can run the Gradle plugin in `dryRun` or `run` mode.

dryRun mode

The following example show how to invoke the plugin in `dryRun` mode.

```
gradle rewriteDryRun --init-script init.gradle \  
-Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

run mode

The following example show how to invoke the plugin in `run` mode.

```
gradle rewriteRun --init-script init.gradle \  
-Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

Current limitations

The current preview release doesn't support the migration of every feature in the V1 SDK. We are adding support for features incrementally.

If the tool cannot migrate a method or class from V1 to V2, the V2 output contains a comment that begins with:

```
/*AWS SDK for Java v2 migration: Transform for ...
```

Following the comment, the tool outputs a generic stub of the V2 version of the method or class. For example, in the following output, the migration tool attempted to migrate the V1 S3 client's `setBucketLifecycleConfiguration` method:

```
/*AWS SDK for Java v2 migration: Transform for setBucketLifecycleConfiguration method  
not supported.  
Please manually migrate your code by using builder pattern, update from  
BucketLifecycleConfiguration.Rule
```

```
to LifecycleRule, StorageClass to TransitionStorageClass, and adjust imports and
names.*/
s3.putBucketLifecycleConfiguration(
    PutBucketLifecycleConfigurationRequest.builder()
        .bucket(bucketName)
        .lifecycleConfiguration(BucketLifecycleConfiguration.builder()
            .build())
        .build());
```

The links in the list below, take you to migration information to help you manually migrate the code.

Migration step-by-step instructions with example

This section provides a step-by-step guide to migrate your application that currently uses the SDK for Java v1.x to the SDK for Java 2.x. The first part presents an overview of the steps followed by a detailed example of a migration.

The steps that are covered here describe a migration of a normal use case, where the application calls AWS services using model-driven service clients. If you need to migrate code that uses higher level APIs such as [S3 Transfer Manager](#) or [CloudFront presigning](#), refer to the section under [the section called “What’s different between 1.x and 2.x”](#) table of contents.

The approach described here is a suggestion. You may use other techniques and leverage your IDE's code editing features to reach the same result.

Overview of steps

1. Begin by adding the SDK for Java 2.x BOM

By adding the Maven BOM (Bill of Materials) element for the SDK for Java 2.x to your POM file, you ensure that all of the v2 dependency you need are from the same version. Your POM can contain both v1 and v2 dependencies. This allows you to incrementally migrate your code rather than change it all at once.

SDK for Java 2.x BOM

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>bom</artifactId>
      <version>2.27.21</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>
```

You can find the [latest version](#) on the Maven Central Repository.

2. Search files for v1 class import statements

By scanning the files in your application for SERVICE_IDs used in v1 imports, you'll find the unique SERVICE_IDs used. A SERVICE_ID is a short, unique name for an AWS service. For example `cognitoidentity` is the SERVICE_ID for Amazon Cognito Identity.

3. Determine the v2 Maven dependencies from the v1 import statements

After you find all unique v1 SERVICE_IDs, you can determine the corresponding Maven artifact for the v2 dependency by referring to [the section called "Package name to artifactId mappings"](#).

4. Add v2 dependency elements to the POM file

Update the Maven POM file with dependency elements determined in step 3.

5. In the Java files, incrementally change over the v1 classes to v2 classes

As you replace v1 classes with v2 classes, make the necessary changes to support the v2 API such as using builders instead of constructors and using fluent getters and setters.

6. Remove v1 Maven dependencies from the POM and v1 imports from files

After you migrate your code to use v2 classes, remove any leftover v1 imports from files and all dependencies from your build file.

7. Refactor the code to use v2 API enhancements

After the code successfully compiles and passes tests, you can take advantage of v2 enhancements such as using a different HTTP client or paginators to simplify code. This is an optional step.

Example migration

In this example, we migrate an application that uses the SDK for Java v1 and accesses several AWS services. We work through the following v1 method in detail in step 5. This is one method in a class that contains eight methods and there are 32 classes in the application.

v1 method to migrate

Only the v1 SDK imports are listed below from the Java file.

```
import com.amazonaws.ClientConfiguration;
import com.amazonaws.regions.Region;
import com.amazonaws.regions.RegionUtils;
import com.amazonaws.services.ec2.AmazonEC2Client;
import com.amazonaws.services.ec2.model.AmazonEC2Exception;
import com.amazonaws.services.ec2.model.CreateTagsRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesResult;
import com.amazonaws.services.ec2.model.Instance;
import com.amazonaws.services.ec2.model.InstanceStateName;
import com.amazonaws.services.ec2.model.Reservation;
import com.amazonaws.services.ec2.model.Tag;
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;
...
private static List<Instance> getRunningInstances(AmazonEC2Client ec2, List<String>
instanceIds) {
    List<Instance> runningInstances = new ArrayList<>();
    try {
        DescribeInstancesRequest request = new DescribeInstancesRequest()
```

```

        .withInstanceIds(instanceIds);
        DescribeInstancesResult result;
        do {
            // DescribeInstancesResponse is a paginated response, so use tokens with
multiple requests.
            result = ec2.describeInstances(request);
            request.setNextToken(result.getNextToken()); // Prepare request for next
page.

            for (final Reservation r : result.getReservations()) {
                for (final Instance instance : r.getInstanceIds()) {
                    LOGGER.info("Examining instanceId: " + instance.getInstanceId());
                    // if instance is in a running state, add it to runningInstances
list.

                    if (RUNNING_STATES.contains(instance.getState().getName())) {
                        runningInstances.add(instance);
                    }
                }
            }
        } while (result.getNextToken() != null);
    } catch (final AmazonEC2Exception exception) {
        // if instance isn't found, assume its terminated and continue.
        if (exception.getErrorCode().equals(NOT_FOUND_ERROR_CODE)) {
            LOGGER.info("Instance probably terminated; moving on.");
        } else {
            throw exception;
        }
    }
    return runningInstances;
}

```

1. Add v2 Maven BOM

Add the Maven BOM for the SDK for Java 2.x to the POM along side any other dependencies in the `dependencyManagement` section. If your POM file has the BOM for v1 of the SDK, leave it for now. It will be removed at a later step.

POM Dependency management at outset

```

<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>org.example</groupId>                <!--Existing dependency in POM. -->
      <artifactId>bom</artifactId>

```

```
<version>1.3.4</version>
<type>pom</type>
<scope>import</scope>
</dependency>
...
<dependency>
  <groupId>com.amazonaws</groupId>
  <artifactId>aws-java-sdk-bom</artifactId>  <!--Existing v1 BOM dependency. -->
  <version>1.11.1000</version>
  <type>pom</type>
  <scope>import</scope>
</dependency>
...
<dependency>
  <groupId>software.amazon.awssdk</groupId>  <!--Add v2 BOM dependency. -->
  <artifactId>bom</artifactId>
  <version>2.27.21</version>
  <type>pom</type>
  <scope>import</scope>
</dependency>
</dependencies>
</dependencyManagement>
```

2. Search files for v1 class import statements

Search the application's code for unique occurrences of `import com.amazonaws.services`. This helps us determine the v1 dependencies used by the project. If your application has a Maven POM file with v1 dependencies listed, you can use this information instead.

For this example we use the [ripgrep \(rg\)](#) command to search the code base.

From the root of your code base, execute the following `ripgrep` command. After `ripgrep` finds the import statements, they are piped to the `cut`, `sort`, and `uniq` commands to isolate the `SERVICE_IDs`.

```
rg --no-filename 'import\s+com\.amazonaws\.services' | cut -d '.' -f 4 | sort | uniq
```

For this application, the following `SERVICE_IDs` are logged to the console.

```
autoscaling
cloudformation
ec2
```

identitymanagement

This indicates that there was at least one occurrence of each of the following package names used in import statements. For our purposes, the individual class names don't matter. We just need to find the SERVICE_IDs that are used.

```
com.amazonaws.services.autoscaling.*
com.amazonaws.services.cloudformation.*
com.amazonaws.services.ec2.*
com.amazonaws.services.identitymanagement.*
```

3. Determine the v2 Maven dependencies from the v1 import statements

The SERVICE_IDs for v1 that we isolated from Step 2—for example autoscaling and cloudformation—can be mapped to the same v2 SERVICE_ID for the most part. Since the v2 Maven artifactId matches the SERVICE_ID in most cases, you have the information you need to add dependency blocks to your POM file.

The following table shows how we can determine the v2 dependencies.

v1 SERVICE_ID maps to ... package name	v2 SERVICE_ID maps to ... package name	v2 Maven dependency
ec2 com.amazonaws.serv ices. ec2 .*	ec2 software.amazon.aw ssdk.services. ec2 .*	<dependency> <groupId>software. amazon.awssdk</gro upId> <artifactId> ec2</ artifactId> </dependency>
autoscaling com.amazonaws.serv ices. autoscaling .*	autoscaling software.amazon.aw ssdk.serv ices. autoscaling .*	<dependency> <groupId>software. amazon.awssdk</gro upId> <artifactId> autoscali ng </artifactId> </dependency>

v1 SERVICE_ID maps to ... package name	v2 SERVICE_ID maps to ... package name	v2 Maven dependency
cloudformation com.amazonaws.services. cloudformation .*	cloudformation software.amazon.awssdk. cloudformation .*	<pre><dependency> <groupId>software.amazon.awssdk</groupId> <artifactId> cloudformation </artifactId> </dependency></pre>
identitymanagement* com.amazonaws.services. identitymanagement .*	iam* software.amazon.awssdk. iam .*	<pre><dependency> <groupId>software.amazon.awssdk</groupId> <artifactId> iam</artifactId> </dependency></pre>

* The identitymanagement to iam mapping is an exception where the SERVICE_ID differs between versions. Refer to the [the section called “Package name to artifactId mappings”](#) for exceptions if Maven or Gradle cannot resolve the v2 dependency.

4. Add v2 dependency elements to the POM file

In step 3, we determined the four dependency blocks that need to be added to the POM file. We don't need to add a version because we have specified the BOM in step 1. After the imports are added, our POM file has the following dependency elements.

```
...
<dependencies>
  ...
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>autoscaling</artifactId>
  </dependency>
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>iam</artifactId>
```

```

</dependency>
<dependency>
  <groupId>software.amazon.awssdk</groupId>
  <artifactId>cloudformation</artifactId>
</dependency>
<dependency>
  <groupId>software.amazon.awssdk</groupId>
  <artifactId>ec2</artifactId>
</dependency>
...
</dependencies>
...

```

5. In the Java files, incrementally change over the v1 classes to v2 classes

In the method that we are migrating, we see

- An EC2 service client from `com.amazonaws.services.ec2.AmazonEC2Client`.
- Several EC2 model classes used. For example `DescribeInstancesRequest` and `DescribeInstancesResult`.

```

import com.amazonaws.ClientConfiguration;
import com.amazonaws.regions.Region;
import com.amazonaws.regions.RegionUtils;
import com.amazonaws.services.ec2.AmazonEC2Client;
import com.amazonaws.services.ec2.model.AmazonEC2Exception;
import com.amazonaws.services.ec2.model.CreateTagsRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesResult;
import com.amazonaws.services.ec2.model.Instance;
import com.amazonaws.services.ec2.model.InstanceStateName;
import com.amazonaws.services.ec2.model.Reservation;
import com.amazonaws.services.ec2.model.Tag;
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;
...
private static List<Instance> getRunningInstances(AmazonEC2Client ec2, List<String>
instanceIds)
{
    List<Instance> runningInstances = new ArrayList<>();
    try {
        DescribeInstancesRequest request = new DescribeInstancesRequest()
            .withInstanceIds(instanceIds);
        DescribeInstancesResult result;
    }
}

```

```

        do {
            // DescribeInstancesResponse is a paginated response, so use tokens with
multiple re
            result = ec2.describeInstances(request);
            request.setNextToken(result.getNextToken()); // Prepare request for next
page.
            for (final Reservation r : result.getReservations()) {
                for (final Instance instance : r.getInstances()) {
                    LOGGER.info("Examining instanceId: " + instance.getInstanceId());
                    // if instance is in a running state, add it to runningInstances
list.
                    if (RUNNING_STATES.contains(instance.getState().getName())) {
                        runningInstances.add(instance);
                    }
                }
            }
        } while (result.getNextToken() != null);
    } catch (final AmazonEC2Exception exception) {
        // if instance isn't found, assume its terminated and continue.
        if (exception.getErrorCode().equals(NOT_FOUND_ERROR_CODE)) {
            LOGGER.info("Instance probably terminated; moving on.");
        } else {
            throw exception;
        }
    }
    return runningInstances;
}
...

```

Our goal is to replace all v1 imports with v2 imports. We proceed one class at a time.

a. Replace import statement or class name

We see that the first parameter to the `describeRunningInstances` method is a v1 `AmazonEC2Client` instance. Do one of the following:

- Replace the import for `com.amazonaws.services.ec2.AmazonEC2Client` with `software.amazon.awssdk.services.ec2.Ec2Client` and change `AmazonEC2Client` to `Ec2Client`.
- Change the parameter type to `Ec2Client` and let the IDE prompt us for the correct import. Our IDE will prompt us to import the v2 class because the client names differ—`AmazonEC2Client` and `Ec2Client`. This approach does not work if the class name is the same in both versions.

b. Replace v1 model classes with v2 equivalents

After the change to the v2 `Ec2Client`, if we use an IDE, we see compilation errors in the following statement.

```
result = ec2.describeInstances(request);
```

The compilation error results from using an instance of v1's `DescribeInstancesRequest` as a parameter to the v2 `Ec2Client` `describeInstances` method. To fix, make the following replacement or import statements.

replace	with
<pre>import com.amazonaws.services.ec2. model.DescribeInstancesRequest</pre>	<pre>import software.amazon.awssdk.serv ices.ec2.model.DescribeInst ancesRequest</pre>

c. Change v1 constructors to v2 builders.

We still see compilation errors because there are [no constructors on v2 classes](#). To fix, make the following change.

change	to
<pre>final DescribeInstancesRequest request = new DescribeInstancesR equest() .withInstanceIds(instanceId sCopy);</pre>	<pre>final DescribeInstancesRequest request = DescribeInstancesR equest.builder() .instanceIds(instanceIdsCop y) .build();</pre>

d. Replace v1 `*Result` response objects with v2 `*Response` equivalents

A consistent difference between v1 and v2 is that all [response objects in v2 end with `\*Response` instead of `\*Result`](#). Replace the v1 `DescribeInstancesResult` import to the v2 import, `DescribeInstancesResponse`.

d. Make API changes

The following statement needs a few changes.

```
request.setNextToken(result.getNextToken());
```

In v2, [setter methods](#) do not use the set or with prefix. Getter methods prefixed with get are also gone in the SDK for Java 2.x

Model classes, such as the request instance, are immutable in v2, so we need to create a new `DescribeInstancesRequest` with a builder.

In v2, the statement becomes the following.

```
request = DescribeInstancesRequest.builder()  
    .nextToken(result.nextToken())  
    .build();
```

d. Repeat until method compiles with v2 classes

Continue with the rest of the code. Replace v1 imports with v2 imports and fix the compilation errors. Refer to the [v2 API Reference](#) and [What's different reference](#) as needed.

After we migrate this single method, we have the following v2 code.

```
import com.amazonaws.ClientConfiguration;  
import com.amazonaws.regions.Region;  
import com.amazonaws.regions.RegionUtils;  
import com.amazonaws.services.ec2.AmazonEC2Client;  
import com.amazonaws.services.ec2.model.AmazonEC2Exception;  
import com.amazonaws.services.ec2.model.CreateTagsRequest;  
import com.amazonaws.services.ec2.model.InstanceStateName;  
import com.amazonaws.services.ec2.model.Tag;  
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;  
  
import software.amazon.awssdk.services.ec2.Ec2Client;  
import software.amazon.awssdk.services.ec2.model.DescribeInstancesRequest;  
import software.amazon.awssdk.services.ec2.model.DescribeInstancesResponse;  
import software.amazon.awssdk.services.ec2.model.Ec2Exception;  
import software.amazon.awssdk.services.ec2.model.Instance;  
import software.amazon.awssdk.services.ec2.model.Reservation;  
...
```

```

private static List<Instance> getRunningInstances(Ec2Client ec2, List<String>
instanceIds) {
    List<Instance> runningInstances = new ArrayList<>();
    try {
        DescribeInstancesRequest request = DescribeInstancesRequest.builder()
            .instanceIds(instanceIds)
            .build();
        DescribeInstancesResponse result;
        do {
            // DescribeInstancesResponse is a paginated response, so use tokens
with multiple re
            result = ec2.describeInstances(request);
            request = DescribeInstancesRequest.builder() // Prepare request for
next page.
                .nextToken(result.nextToken())
                .build();
            for (final Reservation r : result.reservations()) {
                for (final Instance instance : r.instances()) {
                    // if instance is in a running state, add it to
runningInstances list.
                    if (RUNNING_STATES.contains(instance.state().nameAsString())) {
                        runningInstances.add(instance);
                    }
                }
            }
        } while (result.nextToken() != null);
    } catch (final Ec2Exception exception) {
        // if instance isn't found, assume its terminated and continue.
        if (exception.awsErrorDetails().errorCode().equals(NOT_FOUND_ERROR_CODE)) {
            LOGGER.info("Instance probably terminated; moving on.");
        } else {
            throw exception;
        }
    }
    return runningInstances;
}
...

```

Because we are migrating a single method in a Java file with eight methods, we have a mix of v1 and v2 imports as we work through the file. We added the last six import statements as we performed the steps.

After we migrate all the code, there will be no more v1 import statements.

6. Remove v1 Maven dependencies from the POM and v1 imports from files

After we migrate all v1 code in the file, we have the following v2 SDK import statements.

```
import software.amazon.awssdk.core.client.config.ClientOverrideConfiguration;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.regions.ServiceMetadata;
import software.amazon.awssdk.services.ec2.Ec2Client;
import software.amazon.awssdk.services.ec2.model.CreateTagsRequest;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesRequest;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesResponse;
import software.amazon.awssdk.services.ec2.model.Ec2Exception;
import software.amazon.awssdk.services.ec2.model.Instance;
import software.amazon.awssdk.services.ec2.model.InstanceStateName;
import software.amazon.awssdk.services.ec2.model.Reservation;
import software.amazon.awssdk.services.ec2.model.Tag;
import software.amazon.awssdk.services.ec2.model.TerminateInstancesRequest;
```

After we migrate *all* files in our application, we no longer need the v1 dependencies in our POM file. Remove the v1 BOM from the dependencyManagement section, if using, and all v1 dependency blocks.

7. Refactor the code to use v2 API enhancements

For the snippet we have been migrating, we can optionally use a v2 paginator and let the SDK manage the token-based requests for more data.

We can replace the entire do clause with the following.

```
DescribeInstancesIterable responses =
ec2.describeInstancesPaginator(request);

responses.reservations().stream()
    .forEach(reservation -> reservation.instances()
        .forEach(instance -> {
            if
(RUNNING_STATES.contains(instance.state().nameAsString())) {
                runningInstances.put(instance.instanceId(),
instance);
            }
        }));
```

Package name to Maven artifactId mappings

When you migrate your Maven or Gradle project from v1 of the SDK for Java to v2, you need to figure out which dependencies to add to your build file. The approach described in the [the section called “Step-by-step instructions”](#) (step 3) uses the package names in import statements as a starting point to determine the dependencies (as artifactIds) to add to your build file.

You can use the information in this topic to map the v1 package names to v2 artifactIds.

Common naming convention used in package names and Maven artifactIds

The following table shows the common naming convention that the SDKs use for a given SERVICE_ID. A SERVICE_ID is a unique identifier for an AWS service. For example, the SERVICE_ID for the Amazon S3 service is `s3` and `cognitoidentity` is the SERVICE_ID for Amazon Cognito Identity.

v1 package name (import statement)	v1 artifactId	v2 artifactId	v2 package name (import statement)
<code>com.amazonaws.services.SERVICE_ID</code>	<code>aws-java-sdk-SERVICE_ID</code>	<code>SERVICE_ID</code>	<code>software.amazon.awssdk.services.SERVICE_ID</code>

Example for Amazon Cognito Identity (SERVICE_ID: `cognitoidentity`)

<code>com.amazonaws.services.cognitoidentity</code>	<code>aws-java-sdk-cognitoidentity</code>	<code>cognitoidentity</code>	<code>software.amazon.awssdk.services.cognitoidentity</code>

SERVICE_ID differences

Within v1

In some cases the SERVICE_ID differs between the package name and in the artifactId for the same service. For example, the CloudWatch Metrics row of the following table shows that `metrics` is the SERVICE_ID in the package name but `cloudwatchmetrics` is the artifactId's SERVICE_ID.

Within v2

There are no differences in the SERVICE_ID used in package names and artifactIds.

Between v1 and v2

For the majority of services, the SERVICE_ID in v2 is the same as v1's SERVICE_ID in both package names and artifactIds. An example of this is the cognitoentity SERVICE_ID as shown in the previous table. However, some SERVICE_IDs differ between the SDKs as shown in the following table.

A **boldface SERVICE_ID** in either of the v1 columns indicates that it's different from the SERVICE_ID used in v2.

Service name	v1 package name	v1 artifactId	v2 artifactId	v2 package name
	All package names begin with <code>com.amazonaws.services</code> as shown in the first row.	All artifactIds are enclosed in tags as shown in the first row.	All artifactIds are enclosed in tags as shown in the first row.	All package names begin with <code>software.amazon.awssdk</code> as shown in the first row.
API Gateway	<code>com.amazonaws.services.apigateway</code>	<code><artifactId>aws-java-sdk-api-gateway</artifactId></code>	<code><artifactId>apigateway</artifactId></code>	<code>software.amazon.awssdk.services.apigateway</code>
App Registry	appregistry	appregistry	<code>servicecatalogappregistry</code>	<code>servicecatalogappregistry</code>
Application Discovery	<code>applicationdiscovery</code>	discovery	<code>applicationdiscovery</code>	<code>applicationdiscovery</code>
Augmented AI Runtime	augmentedairuntime	augmentedairuntime	<code>sagemaker-a2iruntime</code>	<code>sagemaker-a2iruntime</code>

What's different between the AWS SDK for Java 1.x and 2.x

This section describes the main changes to be aware of when converting an application from using the AWS SDK for Java version 1.x to version 2.x.

Package name change

A noticeable change from the SDK for Java 1.x to the SDK for Java 2.x is the package name change. Package names begin with `software.amazon.awssdk` in SDK 2.x, whereas the SDK 1.x uses `com.amazonaws`.

These same names differentiate Maven artifacts from SDK 1.x to SDK 2.x. Maven artifacts for the SDK 2.x use the `software.amazon.awssdk` groupId, whereas the SDK 1.x uses the `com.amazonaws` groupId.

There are a few times when your code requires a `com.amazonaws` dependency for a project that otherwise uses only SDK 2.x artifacts. One example of this is when you work with server-side AWS Lambda. This was shown in the [Set up an Apache Maven project](#) section earlier in this guide.

Note

Several package names in the SDK 1.x contain `v2`. The use of `v2` in this case usually means that code in the package is targeted to work with version 2 of the service. Since the full package name begins with `com.amazonaws`, these are SDK 1.x components. Examples of these package names in the SDK 1.x are:

- `com.amazonaws.services.dynamodbv2`
- `com.amazonaws.retry.v2`
- `com.amazonaws.services.apigatewayv2`
- `com.amazonaws.services.simpleemailv2`

Adding version 2.x to your project

Maven is the recommended way to manage dependencies when using the AWS SDK for Java 2.x. To add version 2.x components to your project, update your `pom.xml` file with a dependency on the SDK.

Example

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>bom</artifactId>
      <version>2.27.21</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>

<dependencies>
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>dynamodb</artifactId>
  </dependency>
</dependencies>
```

You can also [use version 1.x and 2.x side-by-side](#) as you migrate your project to version 2.x.

Immutable POJOs

Clients and operation request and response objects are now immutable and cannot be changed after creation. To reuse a request or response variable, you must build a new object to assign to it.

Example of updating a request object in 1.x

```
DescribeAlarmsRequest request = new DescribeAlarmsRequest();
DescribeAlarmsResult response = cw.describeAlarms(request);

request.setNextToken(response.getNextToken());
```

Example of updating a request object in 2.x

```
DescribeAlarmsRequest request = DescribeAlarmsRequest.builder().build();
DescribeAlarmsResponse response = cw.describeAlarms(request);

request = DescribeAlarmsRequest.builder()
    .nextToken(response.nextToken())
    .build();
```

Setter and getter methods

In the AWS SDK for Java 2.x, setter method names don't include the set or with prefix. For example, `*.withEndpoint()` is now `*.endpoint()`.

Getter method names do not use the get prefix.

Example of using setter methods in 1.x

```
AmazonDynamoDB client = AmazonDynamoDBClientBuilder.standard()
    .withRegion("us-east-1")
    .build();
```

Example of using setter methods in 2.x

```
DynamoDbClient client = DynamoDbClient.builder()
    .region(Region.US_EAST_1)
    .build();
```

Example of using getter methods in 1.x

```
String token = request.getNextToken();
```

Example of using getter methods in 2.x

```
String token = request.nextToken();
```

Model class names

Model class names that represent service responses end with `Response` in v2 instead of `Result` that v1 uses.

Example of class names that represent a response in v1

```
CreateApiKeyResult  
AllocateAddressResult
```

Example of class names that represent a response in v2

```
CreateApiKeyResponse  
AllocateAddressResponse
```

Migration status of libraries and utilities

SDK for Java libraries and utilities

The following table lists the migration status of libraries and utilities for the SDK for Java.

Version 1.12.x name	Version 2.x name	Since version in 2.x
DynamoDBMapper	DynamoDbEnhancedClient	2.12.0
Waiters	Waiters	2.15.0
CloudFrontUrlSigner, CloudFrontCookieSigner	CloudFrontUtilities	2.18.33
TransferManager	S3TransferManager	2.19.0
EC2 Metadata client	EC2 Metadata client	2.19.29
S3 URI parser	S3 URI parser	2.20.41

Version 1.12.x name	Version 2.x name	Since version in 2.x
IAM Policy Builder	IAM Policy Builder	2.20.126
S3 Event Notifications	S3 Event Notifications	2.25.11
Amazon SQS Client-side Buffering	Automatic Request Batching API for Amazon SQS	2.28.0
Progress Listeners	Progress Listeners	not yet released

Related libraries

The following table lists libraries that are released separately but work with the SDK for Java 2.x.

Name used with version 2.x of the SDK for Java	Since version
Amazon S3 Encryption Client	3.0.0 ¹
AWS Database Encryption Client for DynamoDB	3.0.0 ²

¹The encryption client for Amazon S3 is available by using the following Maven dependency.

```
<dependency>
  <groupId>software.amazon.encryption.s3</groupId>
  <artifactId>amazon-s3-encryption-client-java</artifactId>
  <version>3.x</version>
</dependency>
```

²The AWS Database Encryption Client for DynamoDB is available by using the following Maven dependency.

```
<dependency>
  <groupId>software.amazon.cryptography</groupId>
  <artifactId>aws-database-encryption-sdk-dynamodb</artifactId>
  <version>3.x</version>
```

```
</dependency>
```

Migration details for libraries and utilities

- [S3 URI parsing](#)
- [DynamoDB mapping/document APIs](#)
- [IAM Policy Builder](#)
- [S3 Event Notifications](#)
- SDK metric publishing ([1.x documentation](#), [2.x documentation](#))

Client changes

Client builders

You must create all clients using the client builder method. Constructors are no longer available.

Example of creating a client in version 1.x

```
AmazonDynamoDB ddbClient = AmazonDynamoDBClientBuilder.defaultClient();  
AmazonDynamoDBClient ddbClient = new AmazonDynamoDBClient();
```

Example of creating a client in version 2.x

```
DynamoDbClient ddbClient = DynamoDbClient.create();  
DynamoDbClient ddbClient = DynamoDbClient.builder().build();
```

Client class names

All client class names are now fully camel cased and no longer prefixed by Amazon. These changes are aligned with names used in the AWS CLI.

Example of class names in 1.x

```
AmazonDynamoDB  
AWSACMPCAAsyncClient
```

Example of class names in 2.x

```
DynamoDbClient
AcmAsyncClient
```

Client class name changes

1.x Client	2.x Client
<code>com.amazonaws.services.acmpca.AWSACMPCAAsyncClient</code>	<code>software.amazon.awssdk.services.acm.AcmAsyncClient</code>
<code>com.amazonaws.services.acmpca.AWSACMPCAClient</code>	<code>software.amazon.awssdk.services.acm.AcmClient</code>

<code>com.amazonaws.services.xray.AWSXRayAsyncClient</code>	<code>software.amazon.awssdk.services.xray.XRayAsyncClient</code>
<code>com.amazonaws.services.xray.AWSXRayClient</code>	<code>software.amazon.awssdk.services.xray.XRayClient</code>

Client creation defaults

In version 2.x, the following changes have been made to the default client creation logic.

- The default credential provider chain for S3 no longer includes anonymous credentials. You must manually specify anonymous access to S3 by using the `AnonymousCredentialsProvider`.
- The following environment variables related to default client creation are different.

1.x	2.x
<code>AWS_CBOR_DISABLED</code>	<code>CBOR_ENABLED</code>
<code>AWS_ION_BINARY_DISABLE</code>	<code>BINARY_ION_ENABLED</code>

- The following system properties related to default client creation are different.

1.x	2.x
<code>com.amazonaws.sdk.disableEc2Metadata</code>	<code>aws.disableEc2Metadata</code>
<code>com.amazonaws.sdk.ec2MetadataServiceEndpointOverride</code>	<code>aws.ec2MetadataServiceEndpoint</code>
<code>com.amazonaws.sdk.disableCbor</code>	<code>aws.cborEnabled</code>
<code>com.amazonaws.sdk.disableIonBinary</code>	<code>aws.binaryIonEnabled</code>

- Version 2.x does not support the following system properties.

1.x
<code>com.amazonaws.sdk.disableCertChecking</code>
<code>com.amazonaws.sdk.enableDefaultMetrics</code>
<code>com.amazonaws.sdk.enableThrottledRetry</code>
<code>com.amazonaws.regions.RegionUtils.fileOverride</code>
<code>com.amazonaws.regions.RegionUtils.disableRemote</code>
<code>com.amazonaws.services.s3.disableImplicitGlobalClients</code>

1.x

```
com.amazonaws.sdk.enableInRegionOptimizedMode
```

- Loading Region configuration from a custom `endpoints.json` file is no longer supported.

Client configuration

In 1.x, SDK client configuration was modified by setting a `ClientConfiguration` instance on the client or client builder. In version 2.x, the client configuration is split into separate configuration classes. With the separate configuration classes, you can configure different HTTP clients for async versus synchronous clients but still use the same `ClientOverrideConfiguration` class.

Example of client configuration in version 1.x

```
AmazonDynamoDBClientBuilder.standard()  
.withClientConfiguration(clientConfiguration)  
.build()
```

Example of synchronous client configuration in version 2.x

```
ProxyConfiguration.Builder proxyConfig = ProxyConfiguration.builder();  
  
ApacheHttpClient.Builder httpClientBuilder =  
    ApacheHttpClient.builder()  
        .proxyConfiguration(proxyConfig.build());  
  
ClientOverrideConfiguration.Builder overrideConfig =  
    ClientOverrideConfiguration.builder();  
  
DynamoDbClient client =  
    DynamoDbClient.builder()  
        .httpClientBuilder(httpClientBuilder)  
        .overrideConfiguration(overrideConfig.build())  
        .build();
```

Example of asynchronous client configuration in version 2.x

```
NettyNioAsyncHttpClient.Builder httpClientBuilder =  
    NettyNioAsyncHttpClient.builder();
```

```
ClientOverrideConfiguration.Builder overrideConfig =
    ClientOverrideConfiguration.builder();

ClientAsyncConfiguration.Builder asyncConfig =
    ClientAsyncConfiguration.builder();

DynamoDbAsyncClient client =
    DynamoDbAsyncClient.builder()
        .httpClientBuilder(httpClientBuilder)
        .overrideConfiguration(overrideConfig.build())
        .asyncConfiguration(asyncConfig.build())
        .build();
```

HTTP clients

Notable changes

- In version 2.x, you can change which HTTP client to use at runtime by specifying an implementation using `clientBuilder.httpClientBuilder`.
- When you pass an HTTP client by using `clientBuilder.httpClient` to a service client builder, the HTTP client is not closed by default if the service client closes. This allows you to share HTTP clients between service clients.
- Asynchronous HTTP clients now use non-blocking IO.
- Some operations now use HTTP/2 for improved performance.

Client overrides

Setting	1.x	2.x
	<pre>ClientConfiguration clientConfig =</pre>	<pre>ClientOverrideConfiguration.Builder overrideConfig =</pre>

Setting	1.x	2.x
	<code>new ClientConfiguration()</code>	<code>ClientOverrideConfiguration.builder()</code>
User agent prefix	<code>clientConfig.setUserAgentPrefix(...)</code> <code>clientConfig.withUserAgentPrefix(...)</code>	<code>overrideConfig.advancedOption(SdkAdvancedClientOption.USER_AGENT_PREFIX, ...)</code>
User agent suffix	<code>clientConfig.setUserAgentSuffix(...)</code> <code>clientConfig.withUserAgentSuffix(...)</code>	<code>overrideConfig.advancedOption(SdkAdvancedClientOption.USER_AGENT_SUFFIX, ...)</code>
Signer	<code>clientConfig.setSignerOverride(...)</code> <code>clientConfig.withSignerOverride(...)</code>	<code>overrideConfig.advancedOption(SdkAdvancedClientOption.SIGNER, ...)</code>
Additional headers	<code>clientConfig.addHeader(...)</code> <code>clientConfig.withHeader(...)</code>	<code>overrideConfig.putHeader(...)</code>
Request timeout	<code>clientConfig.setRequestTimeout(...)</code> <code>clientConfig.withRequestTimeout(...)</code>	<code>overrideConfig.apiCallAttemptTimeout(...)</code>

Setting	1.x	2.x
Client execution timeout	<pre>clientConfig.setClientExecutionTimeout(...) clientConfig.withClientExecutionTimeout(...)</pre>	<pre>overrideConfig.apiCallTimeout(...)</pre>
Use Gzip	<pre>clientConfig.setUseGzip(...) clientConfig.withGzip(...)</pre>	Not Supported (Request Feature)
Socket buffer size hint	<pre>clientConfig.setSocketBufferSizeHints(...) clientConfig.withSocketBufferSizeHints(...)</pre>	Not Supported (Request Feature)
Cache response metadata	<pre>clientConfig.setCacheResponseMetadata(...) clientConfig.withCacheResponseMetadata(...)</pre>	Not Supported (Request Feature)
Response metadata cache size	<pre>clientConfig.setResponseMetadataCacheSize(...) clientConfig.withResponseMetadataCacheSize(...)</pre>	Not Supported (Request Feature)

Setting	1.x	2.x
DNS resolver	<pre>clientConfig.setDnsResolver(...) clientConfig.withDnsResolver(...)</pre>	Not Supported (Request Feature)
TCP keepalive	<pre>clientConfig.setUseTcpKeepAlive(...) clientConfig.withTcpKeepAlive(...)</pre>	This option is now in the HTTP Client configuration - <code>ApacheHttpClient.builder().tcpKeepAlive(true)</code> - <code>NettyNioAsyncHttpClient.builder().tcpKeepAlive(true)</code>
Secure random	<pre>clientConfig.setSecureRandom(...) clientConfig.withSecureRandom(...)</pre>	Not Supported (Request Feature)
	<pre>AmazonDynamoDBClientBuilder.standard() .withClientConfiguration(clientConfiguration) .build()</pre>	<pre>DynamoDbClient.builder() .overrideConfiguration(overrideConfiguration.build()) .build()</pre>

Client override retries

Setting	1.x	2.x
	<pre>ClientConfiguration clientConfig = new ClientConfiguration()</pre>	<pre>ClientOverrideConfiguration.Builder overrideConfigBuilder =</pre>

Setting	1.x	2.x
		ClientOverrideConfiguration.builder();
Max error retry	clientConfig.setMaxErrorRetry(...) clientConfig.withMaxErrorRetry(...)	// Configure the default retry strategy. overrideConfigBuilder.retryStrategy(b -> b.maxAttempts(...));
Use throttled retries	clientConfig.setUseThrottleRetries(...) clientConfig.withUseThrottleRetries(...)	Not supported
Max consecutive retries before throttling	clientConfig.setMaxConsecutiveRetriesBeforeThrottling(...) clientConfig.withMaxConsecutiveRetriesBeforeThrottling(...)	Not supported

Setting	1.x	2.x
	<pre>AmazonDynamoDBClientBuilder.standard() .withClientConfiguration(clientConfiguration) .build()</pre>	<pre>DynamoDbClient.builder() .overrideConfiguration(overrideConfigBuilder.build()) .build(); // You also have the option to use a lambda expression to configure and // build the 'ClientOverrideConfiguration.Builder'. DynamoDbClient client = DynamoDbClient.builder() .overrideConfiguration(o -> o.retryStrategy(b -> b.maxAttempts(5))) .build();</pre>

Asynchronous clients

Setting	1.x	2.x
		<pre>ClientAsyncConfiguration.Builder asyncConfig = ClientAsyncConfiguration.builder()</pre>
Executor	<pre>AmazonDynamoDBAsyncClientBuilder.standard()</pre>	<pre>asyncConfig.advancedOption()</pre>

Setting	1.x	2.x
	<pre> .withExecutorFacto ry(...) .build() </pre>	<pre> SdkAdvancedAsyncCl ientOption.FUTURE_ COMPLETION_EXECUTO R, ...) </pre>
		<pre> DynamoDbAsyncClie nt.builder() .asyncConfiguratio n(asyncConfig) .build() </pre>

Other client changes

The following `ClientConfiguration` option from 1.x has changed in 2.x of the SDK and doesn't have a direct equivalent.

Setting	1.x	2.x equivalent
Protocol	<pre> clientConfig.setPr otocol(Protocol.HTTP) clientConfig.w ithProtocol(Protoc ol.HTTP) </pre>	The protocol setting is HTTPS by default. To modify the setting, specify the protocol setting an HTTP endpoint on the client builder: <pre> clientBuilder.endp ointOverride(URI.create("http:/ /...")) </pre>

Credentials provider changes

This section provides a mapping of the name changes of credentials provider classes and methods between versions 1.x and 2.x of the AWS SDK for Java.

Notable differences

- The default credentials provider loads system properties before environment variables in version 2.x. For more information, see [Using credentials](#).
- The constructor method is replaced with the create or builder methods.

Example

```
DefaultCredentialsProvider.create();
```

- Asynchronous refresh is no longer set by default. You must specify it with the builder of the credentials provider.

Example

```
ContainerCredentialsProvider provider = ContainerCredentialsProvider.builder()  
    .asyncCredentialUpdateEnabled(true)  
    .build();
```

- You can specify a path to a custom profile file using the `ProfileCredentialsProvider.builder()`.

Example

```
ProfileCredentialsProvider profile = ProfileCredentialsProvider.builder()  
  
    .profileFile(ProfileFile.builder().content(Paths.get("myProfileFile.file")).build())  
    .build();
```

- Profile file format has changed to more closely match the AWS CLI. For details, see [Configuring the AWS CLI](#) in the *AWS Command Line Interface User Guide*.

Credentials provider changes mapped between versions 1.x and 2.x

AWSCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.AWSCredentialsProvider</code>	<code>software.amazon.awssdk.auth.credentials.AwsCredentialsProvider</code>
Method name	<code>getCredentials</code>	<code>resolveCredentials</code>
Unsupported method	<code>refresh</code>	Not supported

DefaultAWSCredentialsProviderChain

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.DefaultAWSCredentialsProviderChain</code>	<code>software.amazon.awssdk.auth.credentials.DefaultCredentialsProvider</code>
Creation	<code>new DefaultAWSCredentialsProviderChain</code>	<code>DefaultCredentialsProvider.create</code>
Unsupported method	<code>getInstance</code>	Not supported
Priority order of external settings	Environment variables before system properties	System properties before environment variables

AWSStaticCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.AWSStaticCredentialsProvider</code>	<code>software.amazon.awssdk.auth.credentials.StaticCredentialsProvider</code>
Creation	<code>new AWSStaticCredentialsProvider</code>	<code>StaticCredentialsProvider.create</code>

EnvironmentVariableCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.EnvironmentVariableCredentialsProvider</code>	<code>software.amazon.awssdk.auth.credentials.EnvironmentVariableCredentialsProvider</code>
Creation	<code>new EnvironmentVariableCredentialsProvider</code>	<code>EnvironmentVariableCredentialsProvider.create</code>
Environment variable name	<code>AWS_ACCESS_KEY</code>	<code>AWS_ACCESS_KEY_ID</code>
	<code>AWS_SECRET_KEY</code>	<code>AWS_SECRET_ACCESS_KEY</code>

SystemPropertiesCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth. SystemPropertiesC redentialsProvider</code>	<code>software.amazon.aw ssdk.auth.credenti als.SystemProperty CredentialsProvider</code>
Creation	<code>new SystemPro pertiesCredentials Provider</code>	<code>SystemPropertiesCr edentialsProvider. create</code>
System property name	<code>aws.secretKey</code>	<code>aws.secretAccessKey</code>

ProfileCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth .profile.ProfileCr edentialsProvider</code>	<code>software.amazon.aw ssdk.auth.credenti als.ProfileCredent ialsProvider</code>
Creation	<code>new ProfileCr edentialsProvider</code>	<code>ProfileCredentials Provider.create</code>
Location of custom profile	<code>AWS_CREDENTIAL_PRO FILES_FILE</code> environme nt variable <code>new ProfileCr edentialsProvider</code>	<code>AWS_SHARED_CREDENT IALS_FILE</code> environment variable <code>ProfileCredentials Provider.builder</code>

ContainerCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.ContainerCredentialsProvider</code>	<code>software.amazon.awssdk.auth.credentials.ContainerCredentialsProvider</code>
Creation	<code>new ContainerCredentialsProvider</code>	<code>ContainerCredentialsProvider.create</code>
Specify asynchronous refresh	Not supported	Default behavior

InstanceProfileCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.InstanceProfileCredentialsProvider</code>	<code>software.amazon.awssdk.auth.credentials.InstanceProfileCredentialsProvider</code>
Creation	<code>new InstanceProfileCredentialsProvider</code>	<code>InstanceProfileCredentialsProvider.create</code>
Specify asynchronous refresh	<code>new InstanceProfileCredentialsProvider(true)</code>	<code>InstanceProfileCredentialProvider.builder().asyncCredentialUpdateEnabled(true).build()</code>
System property name	<code>com.amazonaws.sdk.disableEc2Metadata</code>	<code>aws.disableEc2Metadata</code>

Change category	1.x	2.x
	<code>com.amazonaws.sdk. ec2MetadataService EndpointOverride</code>	<code>aws.ec2MetadataSer viceEndpoint</code>

STSAssumeRoleSessionCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth .STSAssumeRoleSess ionCredentialsProv ider</code>	<code>software.amazon.aw ssdk.services.sts. auth.StsAssumeRole CredentialsProvider</code>
Creation	<code>new STSAssumeRoleSessionCredentialsProvider</code> <code>new STSAssumeRoleSessionCredentialsProvider.Builder</code>	<code>StsAssumeRoleCreden tialsProvider.bui lder</code>
Asynchronous refresh	Default behavior	Default behavior
Configuration	<code>new STSAssumeRoleSessionCredentialsProvider.Builder</code>	Configure a <code>StsClient</code> and <code>AssumeRoleRequest</code> request

STSSessionCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.STSSessionCredentialsProvider</code>	<code>software.amazon.awssdk.services.sts.auth.StsGetSessionTokenCredentialsProvider</code>
Creation	<code>new STSSessionCredentialsProvider</code>	<code>StsGetSessionTokenCredentialsProvider.builder</code>
Asynchronous refresh	Default behavior	<code>StsGetSessionTokenCredentialsProvider.builder</code>
Configuration	Constructor parameters	Configure an <code>StsClient</code> and <code>GetSessionTokenRequest</code> request in a builder

WebIdentityFederationSessionCredentialsProvider

Change category	1.x	2.x
Package/class name	<code>com.amazonaws.auth.WebIdentityFederationSessionCredentialsProvider</code>	<code>software.amazon.awssdk.services.sts.auth.StsAssumeRoleWithWebIdentityCredentialsProvider</code>
Creation	<code>new WebIdentityFederationSessionCredentialsProvider</code>	<code>StsAssumeRoleWithWebIdentityCredentialsProvider.builder</code>

Change category	1.x	2.x
Asynchronous refresh	Default behavior	<code>StsAssumeRoleWithWebIdentityCredentialsProvider.builder</code>
Configuration	Constructor parameters	Configure an <code>StsClient</code> and <code>AssumeRoleWithWebIdentityRequest</code> request in a builder

Classes replaced

1.x class	2.x replacement classes
<code>com.amazonaws.auth.EC2ContainerCredentialsProviderWrapper</code>	<code>software.amazon.awssdk.auth.credentials.ContainerCredentialsProvider</code> and <code>software.amazon.awssdk.auth.credentials.InstanceProfileCredentialsProvider</code>
<code>com.amazonaws.services.s3.S3CredentialsProviderChain</code>	<code>software.amazon.awssdk.auth.credentials.DefaultCredentialsProvider</code> and <code>software.amazon.awssdk.auth.credentials.AnonymousCredentialsProvider</code>

Classes removed

1.x class
<code>com.amazonaws.auth.ClasspathPropertiesFileCredentialsProvider</code>
<code>com.amazonaws.auth.PropertiesFileCredentialsProvider</code>

Region changes

This section describes the changes implemented in the AWS SDK for Java 2.x for using the Region and Regions classes.

Region configuration

- Some AWS services don't have Region specific endpoints. When using those services, you must set the Region as `Region.AWS_GLOBAL` or `Region.AWS_CN_GLOBAL`.

Example

```
Region region = Region.AWS_GLOBAL;
```

- `com.amazonaws.regions.Regions` and `com.amazonaws.regions.Region` classes are now combined into one class, `software.amazon.awssdk.regions.Region`.

Method and class name mappings

The following tables map Region related classes between versions 1.x and 2.x of the AWS SDK for Java. You can create an instance of these classes using the `of()` method.

Example

```
RegionMetadata regionMetadata = RegionMetadata.of(Region.US_EAST_1);
```

1.x Regions class method changes

1.x	2.x
<code>Regions.fromName</code>	<code>Region.of</code>
<code>Regions.getName</code>	<code>Region.id</code>
<code>Regions.getDescription</code>	<code>Region.metadata().description()</code>
<code>Regions.getCurrentRegion</code>	Not Supported
<code>Regions.DEFAULT_REGION</code>	Not Supported

1.x	2.x
<code>Regions.name</code>	<code>Region.id</code>

1.x Region class method changes

1.x	2.x
<code>Region.getName</code>	<code>Region.id</code>
<code>Region.hasHttpsEndpoint</code>	Not Supported
<code>Region.hasHttpEndpoint</code>	Not Supported
<code>Region.getAvailableEndpoints</code>	Not Supported
<code>Region.createClient</code>	Not Supported

RegionMetadata class method changes

1.x	2.x
<code>RegionMetadata.getName</code>	<code>RegionMetadata.name</code>
<code>RegionMetadata.getDomain</code>	<code>RegionMetadata.domain</code>
<code>RegionMetadata.getPartition</code>	<code>RegionMetadata.partition</code>

ServiceMetadata class method changes

1.x	2.x
<code>Region.getServiceEndpoint</code>	<code>ServiceMetadata.endpointFor(Region)</code>
<code>Region.isServiceSupported</code>	<code>ServiceMetadata.regions().contains(Region)</code>

Operations, requests and responses changes

In v2.x of the SDK for Java, requests are passed to a client operation. For example `DynamoDbClient`'s `PutItemRequest` is passed to `DynamoDbClient.putItem` operation. These operations return a response from the AWS service, such as a `PutItemResponse`.

Version 2.x of the SDK for Java has the following changes from 1.x.

- Operations with multiple response pages now have a `Paginator` method for automatically iterating over all items in the response.
- You cannot mutate requests and responses.
- You must create requests and responses with a static builder method instead of a constructor. For example, 1.x's `new PutItemRequest().withTableName(...)` is now `PutItemRequest.builder().tableName(...).build()`.
- Operations support a short-hand way to create requests: `dynamoDbClient.putItem(request -> request.tableName(...))`.

Streaming operation differences between 1.x and 2.x of the AWS SDK for Java

Streaming operations, such as Amazon S3 `getObject` and `putObject` methods, support non-blocking I/O in version 2.x of the SDK. As a result, the request and response model objects no longer take an `InputStream` as a parameter. Instead, for synchronous requests the request object accepts `RequestBody`, which is a stream of bytes. The asynchronous equivalent accepts an `AsyncRequestBody`.

Example of Amazon S3 `putObject` operation in 1.x

```
s3client.putObject(BUCKET, KEY, new File(file_path));
```

Example of Amazon S3 `putObject` operation in 2.x

```
s3client.putObject(PutObjectRequest.builder()  
    .bucket(BUCKET)  
    .key(KEY)  
    .build(),  
    RequestBody.of(Paths.get("myfile.in")));
```

A streaming response object accepts a `ResponseTransformer` for synchronous clients and a `AsyncResponseTransformer` for asynchronous clients in V2.

Example of Amazon S3 `getObject` operation in 1.x

```
S3Object o = s3.getObject(bucket, key);
S3ObjectInputStream s3is = o.getObjectContent();
FileOutputStream fos = new FileOutputStream(new File(key));
```

Example of Amazon S3 `getObject` operation in 2.x

```
s3client.getObject(GetObjectRequest.builder().bucket(bucket).key(key).build(),
    ResponseTransformer.toFile(Paths.get("key")));
```

In the SDK for Java 2.x, streaming response operations have an `AsBytes` method to load the response into memory and simplify common type conversions in-memory.

Serialization differences between 1.x and 2.x of the AWS SDK for Java

List objects to request parameters difference

The SDK for Java v1.x and v2.x differ in how they serialize List objects to request parameters.

The SDK for Java 1.x does not serialize an empty list, whereas the SDK for Java 2.x serializes an empty list as an empty parameter.

For example, consider a service with a `SampleOperation` that takes a `SampleRequest`. The `SampleRequest` accepts two parameters—a String type `str1` and List type `listParam`—as shown in the following examples.

Example of `SampleOperation` in 1.x

```
SampleRequest v1Request = new SampleRequest()
    .withStr1("TestName");

sampleServiceV1Client.sampleOperation(v1Request);
```

Wire-level logging shows that the `listParam` parameter is not serialized.

```
Action=SampleOperation&Version=2011-01-01&str1=TestName
```

Example of SampleOperation in 2.x

```
sampleServiceV2Client.sampleOperation(b -> b
    .str1("TestName"));
```

Wire-level logging shows that the `listParam` parameter is serialized with no value.

```
Action=SampleOperation&Version=2011-01-01&str1=TestName&listParam=
```

POJOs in V1 compared to builders in V2

Because the V1 SDK for Java uses mutable POJO classes, serialization and deserialization libraries—such as [Jackson](#)—can use model objects directly.

The V2 SDK for Java, by contrast, uses immutable model objects. You must use an intermediate builder to perform de/serialization.

The following example shows the differences between de/serializing a `headBucket` API call with V1 and V2 using a Jackson `ObjectMapper`.

```
public void sendRequest() throws IOException {
    final String bucketName = "amzn-s3-demo-bucket";
    final ObjectMapper mapper = new ObjectMapper();

    // V1 uses POJOs to serialize and deserialize.
    final AmazonS3 v1S3Client = AmazonS3ClientBuilder.defaultClient();
    HeadBucketResult resultV1 = v1S3Client.headBucket(
        new HeadBucketRequest(bucketName));

    String v1Serialized = mapper.writeValueAsString(resultV1);

    HeadBucketResult deserializedV1 = mapper.readValue(v1Serialized,
        HeadBucketResult.class);

    // V2 uses builders to serialize and deserialize.
    S3Client v2S3Client = S3Client.create();
    HeadBucketResponse v2Response = v2S3Client.headBucket(
        b -> b.bucket(bucketName));

    String v2Serialized = mapper.writeValueAsString(
        v2Response.toBuilder());
}
```

```

        HeadBucketResponse v2Deserialized = mapper.readValue(
            v2Serialized, HeadBucketResponse.serializableBuilderClass()
                .build());
    }

```

Deserialization differences between 1.x and 2.x of the AWS SDK for Java

Empty collections in V2 compared to nulls in V1

The SDK for Java v1.x and v2.x differ in how they deserialize JSON responses with lists and maps that are empty.

When the SDK receives a response with a missing property that is modeled as a list or map, V1 deserializes the missing property to `null`, whereas V2 deserializes the property to an immutable empty collection object.

For example, consider the response returned for the `describeTable` method from a DynamoDB client. The following example method contains a V2 DynamoDB client and a V1 DynamoDB client that both execute the `describeTable` method on a table that has no global secondary indexes

Example of the deserialization of a property modeled as a list that is missing in the response

```

public void deserializationDiffs(){

    DescribeTableResponse v2Response = dynamoDbClientV2.describeTable(builder ->
        builder.tableName(TABLE_NAME));
    // V2 provides has* methods on model objects for list/map members. No null check
    // needed.
    LOGGER.info( String.valueOf(v2Response.table().hasGlobalSecondaryIndexes()) );

    LOGGER.info( String.valueOf(v2Response.table().globalSecondaryIndexes().isEmpty()) );
    // V2 deserialize to an empty collection.
    LOGGER.info(v2Response.table().globalSecondaryIndexes().toString());

    // V1 deserialize to null.
    DescribeTableResult v1Result = dynamoDbClientV1.describeTable(new
        DescribeTableRequest(TABLE_NAME));
    if (v1Result.getTable().getGlobalSecondaryIndexes() != null){
        LOGGER.info(v1Result.getTable().getGlobalSecondaryIndexes().toString());
    } else {
        LOGGER.info("The list of global secondary indexes returned by the V1 call is
        <null>");
    }
}

```

```
}
```

The following shows the logged output:

```
INFO org.example.DeserializationDifferences:45 - false
INFO org.example.DeserializationDifferences:46 - true
INFO org.example.DeserializationDifferences:48 - []
INFO org.example.DeserializationDifferences:55 - The list of global secondary indexes
        returned by the V1 call is <null>
```

The Java SDK 2.x takes an idiomatic approach by deserializing empty lists and maps to immutable empty collections instead of returning `null`, promoting safer and more concise code. With V2, you can check if a service returned an attribute modeled as a list or map with the `has*` method, such as the `hasGlobalSecondaryIndexes` shown in the previous example.

This approach avoids the need for explicit `null` checks and aligns with modern Java best practices for handling absent or empty data structures.

Complete example

```
package org.example;

import com.amazonaws.regions.Regions;
import com.amazonaws.services.dynamodbv2.AmazonDynamoDB;
import com.amazonaws.services.dynamodbv2.AmazonDynamoDBClientBuilder;
import com.amazonaws.services.dynamodbv2.model.DescribeTableRequest;
import com.amazonaws.services.dynamodbv2.model.DescribeTableResult;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.dynamodb.DynamoDbClient;
import software.amazon.awssdk.services.dynamodb.model.BillingMode;
import software.amazon.awssdk.services.dynamodb.model.DescribeTableResponse;
import software.amazon.awssdk.services.dynamodb.model.KeyType;
import software.amazon.awssdk.services.dynamodb.model.ScalarAttributeType;

import java.util.UUID;

public class DeserializationDifferences {
    private static final Logger LOGGER =
        LoggerFactory.getLogger(DeserializationDifferences.class);
    private static final String TABLE_NAME = "DeserializationTable-" +
        UUID.randomUUID();
```

```

DynamoDbClient dynamoDbClientV2 = DynamoDbClient.create();
AmazonDynamoDB dynamoDbClientV1 =
AmazonDynamoDBClientBuilder.standard().withRegion(Regions.US_EAST_1).build();

public static void main(String[] args) {

    DeserializationDifferences difference = new DeserializationDifferences();
    difference.createTable();
    difference.deserializationDiffs();
    difference.deleteTable();
}

public void createTable(){
    dynamoDbClientV2.createTable(b -> b
        .billingMode(BillingMode.PAY_PER_REQUEST)
        .tableName(TABLE_NAME)
        .keySchema(b1 -> b1.attributeName("Id").keyType(KeyType.HASH))
        .attributeDefinitions(b2 ->
b2.attributeName("Id").attributeType(ScalarAttributeType.S)));
    dynamoDbClientV2.waiter().waitUntilTableExists(b -> b.tableName(TABLE_NAME));
}

public void deserializationDiffs(){

    DescribeTableResponse v2Response = dynamoDbClientV2.describeTable(builder ->
builder.tableName(TABLE_NAME));
    // V2 provides has* methods on model objects for list/map members. No null
check needed.
    LOGGER.info( String.valueOf(v2Response.table().hasGlobalSecondaryIndexes()) );

    LOGGER.info( String.valueOf(v2Response.table().globalSecondaryIndexes().isEmpty()) );
    // V2 deserialize to an empty collection.
    LOGGER.info(v2Response.table().globalSecondaryIndexes().toString());

    // V1 deserialize to null.
    DescribeTableResult v1Result = dynamoDbClientV1.describeTable(new
DescribeTableRequest(TABLE_NAME));
    if (v1Result.getTable().getGlobalSecondaryIndexes() != null){
        LOGGER.info(v1Result.getTable().getGlobalSecondaryIndexes().toString());
    } else {
        LOGGER.info("The list of global secondary indexes returned by the V1 call
is <null>");
    }
}
}

```

```

public void deleteTable(){
    dynamoDbClientV2.deleteTable(b -> b.tableName(TABLE_NAME));
    dynamoDbClientV2.waiter().waitUntilTableNotExists(b ->
b.tableName(TABLE_NAME));
}
}

```

The JSON response for the `describeTable` method from the V1 and V2 client contains no `GlobalSecondaryIndexes` attribute:

```

{
  "Table": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Id",
        "AttributeType": "S"
      }

  }
}
```

Exception changes

Exception class names, their structures, and their relationships have changed. `software.amazon.awssdk.core.exception.SdkException` is the new base Exception class that all the other exceptions extend.

This table maps the exception class name changes.

1.x	2.x
<code>com.amazonaws.SdkBaseException</code> <code>com.amazonaws.AmazonClientException</code>	<code>software.amazon.awssdk.core.exception.SdkException</code>
<code>com.amazonaws.SdkClientException</code>	<code>software.amazon.awssdk.core.exception.SdkClientException</code>
<code>com.amazonaws.AmazonServiceException</code>	<code>software.amazon.awssdk.awscore.exception.AwsServiceException</code>

The following table maps the methods on exception classes between version 1.x and 2.x.

1.x	2.x
<code>AmazonServiceException.getRequestId</code>	<code>SdkServiceException.requestId</code>

1.x	2.x
<code>AmazonServiceException.getServiceName</code>	<code>AwsServiceException.awsErrorDetails().serviceName</code>
<code>AmazonServiceException.getErrorCode</code>	<code>AwsServiceException.awsErrorDetails().errorCode</code>
<code>AmazonServiceException.getErrorMessage</code>	<code>AwsServiceException.awsErrorDetails().errorMessage</code>
<code>AmazonServiceException.getStatusCode</code>	<code>AwsServiceException.awsErrorDetails().sdkHttpResponse().statusCode</code>
<code>AmazonServiceException.getHttpHeaders</code>	<code>AwsServiceException.awsErrorDetails().sdkHttpResponse().headers</code>
<code>AmazonServiceException.getRawResponse</code>	<code>AwsServiceException.awsErrorDetails().rawResponse</code>

Service-specific changes

Amazon S3 changes

SDK for Java 2.x disables anonymous access by default. As a result, you must enable anonymous access by using the `AnonymousCredentialsProvider`.

Operation name changes

Many of the operation names for the Amazon S3 client have changed in the AWS SDK for Java 2.x. In version 1.x, the Amazon S3 client is not generated directly from the service API. This results in inconsistency between the SDK operations and the service API. In version 2.x, we now generate the Amazon S3 client to be more consistent with the service API.

The following table shows the operation names in the two versions.

Amazon S3 Operation names

1.x	2.x

Amazon SNS changes

An SNS client can no longer access SNS topics in Regions other than the Region that it is configured to access.

Amazon SQS changes

An SQS client can no longer access SQS queues in Regions other than the Region that it is configured to access.

Amazon RDS changes

The SDK for Java 2.x uses `RdsUtilities#generateAuthenticationToken` in place of the class `RdsIamAuthTokenGenerator` in 1.x.

Changes in working with Amazon S3 from version 1 to version 2 of the AWS SDK for Java

The AWS SDK for Java 2.x introduces significant changes to the S3 client, including a new package structure, updated class names, and revised method signatures. While many methods can be automatically migrated from V1 to V2 using the [migration tool](#), some require manual migration, such as `listNextBatchOfObjects` and `selectObjectContent`. Additionally, V2 replaces certain V1 classes like `AccessControlList` and `CannedAccessControlList` with new implementations.

S3 client differences between version 1 and version 2 of the AWS SDK for Java

In this topic, the differences between the S3 clients in version 1 and version 2 of SDK for Java are organized by how the [migration tool](#) can automate the migration. The tool supports migration of most methods from V1 to V2, but some methods require manual migration. In addition to S3 client methods, some S3 V1 classes do not have a direct V2 equivalent requiring you to manually migrate them.

Example V1 methods supported by the migration tool

The migration tool automatically migrates most methods from V1 to V2. The `putObject` and `getObject` methods are two examples.

putObject

```
// SDK V1
```

```
s3Client.putObject("my-bucket", "my-key", "Hello World!");

// SDK V2
s3Client.putObject(req -> req
    .bucket("my-bucket")
    .key("my-key"),
    RequestBody.fromString("Hello World!"));
```

getObject

```
// SDK V1
S3Object object = s3Client.getObject("my-bucket", "my-key");
InputStream content = object.getObjectContent();

// SDK V2
ResponseInputStream<GetObjectResponse> response = s3Client.getObject(req -> req
    .bucket("my-bucket")
    .key("my-key"));
```

V1 methods that require manual migration

You need to manually migrate the following V1 S3 client methods. When you use the migration tool, you see a comment in the V2 output Java file that directs you to this topic.

V1's getObject using V1's S3ObjectID to V2's GetObjectRequest.builder()

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

S3ObjectID s3objectId = new S3ObjectID(
    "my-bucket",
    "object-key",
    "abc123version"
);

GetObjectRequest getRequest= new GetObjectRequest(s3objectId);
S3Object s3objectVersioned = s3Client.getObject(getRequest);
```

```
// SDK V2
// V2 does not include a 'S3ObjectId' class. V2 uses the request builder pattern
// to supply the bucket, key, and version parameters.
S3Client s3Client = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

GetObjectRequest getRequest = GetObjectRequest.builder()
    .bucket("my-bucket")
    .key("object-key")
    .versionId("abc123version")
    .build();

ResponseInputStream<GetObjectResponse> response = s3Client.getObject(getRequest);
```

V1's `listNextBatchOfObjects` to V2's `listObjectsV2Paginator`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

ObjectListing objectListing = s3ClientV1.listObjects("bucket-name");
while (objectListing.isTruncated()) {
    objectListing = s3ClientV1.listNextBatchOfObjects(objectListing);
    for (S3ObjectSummary summary : objectListing.getObjectSummaries()) {
        System.out.println(summary.getKey());
    }
}

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

ListObjectsV2Request request = ListObjectsV2Request.builder()
    .bucket("bucket-name")
    .build();

// V2 returns a paginator.
ListObjectsV2Iterable responses = s3ClientV2.listObjectsV2Paginator(request);
```

```
for (ListObjectsV2Response page : responses) {
    page.contents().forEach(content -> {
        System.out.println(content.key());
    });
}
```

V1's `listNextBatchOfVersions` to V2's `listObjectVersionsPaginator`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

VersionListing versionListing = s3ClientV1.listVersions("bucket-name", "prefix");
while (versionListing.isTruncated()) {
    versionListing = s3ClientV1.listNextBatchOfVersions(versionListing);
    for (S3VersionSummary version : versionListing.getVersionSummaries()) {
        System.out.println(version.getKey() + " " + version.getVersionId());
    }
}

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

ListObjectVersionsRequest request = ListObjectVersionsRequest.builder()
    .bucket("bucket-name")
    .prefix("prefix")
    .build();

// V2 returns a paginator.
ListObjectVersionsIterable responses = s3ClientV2.listObjectVersionsPaginator(request);

for (ListObjectVersionsResponse page : responses) {
    page.versions().forEach(version -> {
        System.out.println(version.key() + " " + version.versionId());
    });
}
```

selectObjectContent

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

SelectObjectContentRequest request = new SelectObjectContentRequest()
    .withBucket("bucket-name")
    .withKey("object-key")
    .withExpression("select * from S3object")
    .withExpressionType(ExpressionType.SQL)

SelectObjectContentResult result = s3ClientV1.selectObjectContent(request);
InputStream resultInputStream = result.getPayload().getRecordsInputStream();

// SDK V2
// In V2, 'selectObjectContent()' is available only on the S3AsyncClient.
// V2 handles responses using an event-based 'SelectObjectContentEventStream'.
S3AsyncClient s3ClientV2 = S3AsyncClient.builder()
    .region(Region.US_WEST_2)
    .build();

SelectObjectContentRequest request = SelectObjectContentRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .expression("select * from S3object")
    .expressionType(ExpressionType.SQL)
    .build();

SelectObjectContentResponseHandler handler = new SelectObjectContentResponseHandler() {
    // Implement the required abstract methods such as 'onEventStream()'.
};

CompletableFuture<Void> future = s3ClientV2.selectObjectContent(request, handler);
// The 'SelectObjectContentResponseHandler' implementation processes the results.
```

V1's setBucketAcl to V2's acl method on PutBucketAclRequest.builder()

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
```

```
.withRegion(Regions.US_WEST_2)
.build();

AccessControlList acl = new AccessControlList();
acl.grantPermission(GroupGrantee.AllUsers, Permission.Read);
s3ClientV1.setBucketAcl("bucket-name", acl);

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutBucketAclRequest request = PutBucketAclRequest.builder()
    .bucket("bucket-name")
    .acl(BucketCannedACL.PRIVATE)
    .build();

s3ClientV2.putBucketAcl(request);
```

V1's setObjectAcl to V2's acl method on PutObjectAclRequest.builder()

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

AccessControlList acl = new AccessControlList();
acl.grantPermission(GroupGrantee.AllUsers, Permission.Read);
s3ClientV1.setObjectAcl("bucket-name", "object-key", acl);

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutObjectAclRequest request = PutObjectAclRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .acl(ObjectCannedACL.PRIVATE)
    .build();
```

```
s3ClientV2.putObjectAcl(request);
```

V1's `initiateMultipartUpload` to V2's `createMultipartUpload`

Example migration

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

ObjectMetadata metadata = new ObjectMetadata();
metadata.setContentType("application/zip");
metadata.addUserMetadata("mykey", "myvalue");

InitiateMultipartUploadRequest initRequest = new InitiateMultipartUploadRequest(
    "bucket-name",
    "object-key",
    metadata
);

InitiateMultipartUploadResult initResponse =
    s3ClientV1.initiateMultipartUpload(initRequest);
String uploadId = initResponse.getUploadId();

// SDK V2
// V1 uses ObjectMetadata methods, whereas V2 uses a simple Map.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

CreateMultipartUploadRequest createMultipartRequest =
    CreateMultipartUploadRequest.builder()
        .bucket("my-bucket")
        .key("object-key")
        .contentType("application/zip")
        .metadata(Collections.singletonMap("mykey", "myvalue"))
        .build();

CreateMultipartUploadResponse response =
    s3ClientV2.createMultipartUpload(createMultipartRequest);
String uploadId = response.uploadId();
```

Implementation differences

The default Content-Type header value for the following methods differ as shown in the following table.

SDK version	Method	Default Content-Type value
version 1	initiateMultipartUpload	application/octet-stream
version 2	createMultipartUpload	binary/octet-stream

V1's setRegion to V2's region method on client builder

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard().build();
s3ClientV1.setRegion(Region.getRegion(Regions.US_WEST_2));

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();
```

V1's setS3ClientOptions(S3ClientOptions clientOptions)

Instead of using a single S3ClientOptions object with the setS3ClientOptions method, V2 provides methods on the client builder to set options.

V1's setBucketLoggingConfiguration to V2's putBucketLogging

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

BucketLoggingConfiguration loggingConfig = new BucketLoggingConfiguration();
loggingConfig.setDestinationBucketName("log-bucket");
```

```

SetBucketLoggingConfigurationRequest request = new
    SetBucketLoggingConfigurationRequest(
        "source-bucket",
        loggingConfig
    );

s3ClientV1.setBucketLoggingConfiguration(request);

// SDK V2
// In V2, V1's 'BucketLoggingConfiguration' is replaced by 'BucketLoggingStatus'
// and 'LoggingEnabled'.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

LoggingEnabled loggingEnabled = LoggingEnabled.builder()
    .targetBucket("log-bucket")
    .build();

BucketLoggingStatus loggingStatus = BucketLoggingStatus.builder()
    .loggingEnabled(loggingEnabled)
    .build();

PutBucketLoggingRequest request = PutBucketLoggingRequest.builder()
    .bucket("source-bucket")
    .bucketLoggingStatus(loggingStatus)
    .build();

s3ClientV2.putBucketLogging(request);

```

V1's `setBucketLifecycleConfiguration` to V2's `putBucketLifecycleConfiguration`

```

// SDK V1
BucketLifecycleConfiguration.Rule rule = new BucketLifecycleConfiguration.Rule()
    .withId("Archive and Delete Rule")
    .withPrefix("documents/")
    .withStatus(BucketLifecycleConfiguration.ENABLED)
    .withTransitions(Arrays.asList(
        new Transition()
            .withDays(30)
            .withStorageClass(StorageClass.StandardInfrequentAccess.toString()),

```

```

        new Transition()
            .withDays(90)
            .withStorageClass(StorageClass.Glacier.toString())
    ))
    .withExpirationInDays(365);

BucketLifecycleConfiguration configuration = new BucketLifecycleConfiguration()
    .withRules(Arrays.asList(rule));

s3ClientV1.setBucketLifecycleConfiguration("my-bucket", configuration);

// SDK V2
LifecycleRule rule = LifecycleRule.builder()
    .id("Archive and Delete Rule")
    .filter(LifecycleRuleFilter.builder()
        .prefix("documents/")
        .build())
    .status(ExpirationStatus.ENABLED)
    .transitions(Arrays.asList(
        Transition.builder()
            .days(30)
            .storageClass(TransitionStorageClass.STANDARD_IA)
            .build(),
        Transition.builder()
            .days(90)
            .storageClass(TransitionStorageClass.GLACIER)
            .build()
    ))
    .expiration(LifecycleExpiration.builder()
        .days(365)
        .build())
    .build();

PutBucketLifecycleConfigurationRequest request =
    PutBucketLifecycleConfigurationRequest.builder()
        .bucket("my-bucket")
        .lifecycleConfiguration(BucketLifecycleConfiguration.builder()
            .rules(rule)
            .build())
        .build();

s3ClientV2.putBucketLifecycleConfiguration(request);

```

V1's `setBucketTaggingConfiguration` to V2's `putBucketTagging`

```
// SDK V1
List<TagSet> tagsets = new ArrayList<>();
TagSet tagSet = new TagSet();
tagSet.setTag("key1", "value1");
tagSet.setTag("key2", "value2");
tagsets.add(tagSet);

BucketTaggingConfiguration bucketTaggingConfiguration = new
    BucketTaggingConfiguration();
bucketTaggingConfiguration.setTagSets(tagsets);

SetBucketTaggingConfigurationRequest request = new
    SetBucketTaggingConfigurationRequest(
        "my-bucket",
        bucketTaggingConfiguration
    );

s3ClientV1.setBucketTaggingConfiguration(request);

// SDK V2
Tagging tagging = Tagging.builder()
    .tagSet(Arrays.asList(
        Tag.builder()
            .key("key1")
            .value("value1")
            .build(),
        Tag.builder()
            .key("key2")
            .value("value2")
            .build()
    ))
    .build();

PutBucketTaggingRequest request = PutBucketTaggingRequest.builder()
    .bucket("my-bucket")
    .tagging(tagging)
    .build();

s3ClientV2.putBucketTagging(request);
```

V1 classes that require manual migration

V1's `AccessControlList` to V2's `AccessControlPolicy`

```
// SDK V1
AccessControlList aclV1 = new AccessControlList();
aclV1.setOwner(new Owner("owner-id", "owner-name"));
aclV1.grantPermission(GroupGrantee.AllUsers, Permission.Read);

// SDK V2
// To migrate from V1 to V2, replace direct 'AccessControlList' modifications with an
// 'AccessControlPolicy.builder()' that contains both owner information and grants.
// Note that V2's approach requires building the complete permission set upfront rather
// than modifying permissions incrementally.
AccessControlPolicy acpV2 = AccessControlPolicy.builder()
    .owner(Owner.builder()
        .id("owner-id")
        .displayName("owner-name")
        .build())
    .grants(Arrays.asList(
        Grant.builder()
            .grantee(Grantee.builder()
                .type(Type.GROUP)
                .uri("http://acs.amazonaws.com/groups/global/AllUsers")
                .build())
            .permission(Permission.READ)
            .build()
    ))
    .build();
```

V1's `CannedAccessControlList` enum to V2's `BucketCannedACL` and `ObjectCannedACL` enums

```
// SDK V1
// In V1, 'CannedAccessControlList' is an enumeration of predefined ACLs.
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard().build();

// Creating a bucket.
s3ClientV1.setBucketAcl("bucket-name", CannedAccessControlList.PublicRead);

// Creating an object.
PutObjectRequest putObjectRequest = new PutObjectRequest("bucket-name", "object-key",
    file)
```

```

        .withCannedAcl(CannedAccessControlList.PublicRead);
s3ClientV1.putObject(putObjectRequest);

// SDK V2
// V2 replaces V1's 'CannedAccessControlList' with 'BucketCannedACL' for buckets and
// 'ObjectCannedACL' for objects.
S3Client s3ClientV2 = S3Client.builder().build();

// Creating a bucket.
PutBucketAclRequest bucketRequest = PutBucketAclRequest.builder()
    .bucket("bucket-name")
    .acl(BucketCannedACL.PRIVATE)
    .build();
s3ClientV2.putBucketAcl(bucketRequest);

// Creating an object.
PutObjectRequest objectRequest = PutObjectRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .acl(ObjectCannedACL.PUBLIC_READ)
    .build();
s3ClientV2.putObject(objectRequest, RequestBody.fromFile(file));

```

V1's BucketNotificationConfiguration to V2's NotificationConfiguration

```

//SDK V1
BucketNotificationConfiguration notificationConfig = new
    BucketNotificationConfiguration();

// Adding configurations by name
notificationConfig.addConfiguration("lambdaConfig",
    new LambdaConfiguration("arn:aws:lambda:function", "s3:ObjectCreated:"));

notificationConfig.addConfiguration("topicConfig",
    new TopicConfiguration("arn:aws:sns:topic", "s3:ObjectRemoved:"));

notificationConfig.addConfiguration("queueConfig",
    new QueueConfiguration("arn:aws:sqs:queue", "s3:ObjectRestore:*"));

s3Client.setBucketNotificationConfiguration("bucket", notificationConfig);

```

```
// SDK V2
// In V2, V1's BucketNotificationConfiguration is renamed to
// NotificationConfiguration.
// V2 contains no common abstract class for LambdaFunction/Topic/Queue configurations.
NotificationConfiguration notificationConfig = NotificationConfiguration.builder()
    .lambdaFunctionConfigurations(
        LambdaFunctionConfiguration.builder()
            .lambdaFunctionArn("arn:aws:lambda:function")
            .events(Event.valueOf("s3:ObjectCreated:"))
            .build())
    .topicConfigurations(
        TopicConfiguration.builder()
            .topicArn("arn:aws:sns:topic")
            .events(Event.valueOf("s3:ObjectRemoved:"))
            .build())
    .queueConfigurations(
        QueueConfiguration.builder()
            .queueArn("arn:aws:sqs:queue")
            .events(Event.valueOf("s3:ObjectRestore:*"))
            .build())
    .build();

s3Client.putBucketNotificationConfiguration(req -> req
    .bucket("bucket")
    .notificationConfiguration(notificationConfig));
```

V1's MultiFactorAuthentication to V2's mfa method on a request builder

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

BucketVersioningConfiguration versioningConfig = new BucketVersioningConfiguration()
    .withStatus(BucketVersioningConfiguration.ENABLED);

// Create an MFA configuration object.
MultiFactorAuthentication mfa = new MultiFactorAuthentication(
    "arn:aws:iam::1234567890:mfa/user",
    "123456"
);

// Create the request object.
```

```
SetBucketVersioningConfigurationRequest request = new
    SetBucketVersioningConfigurationRequest(
        "bucket-name",
        versioningConfig,
        mfa
    );

// Send the request.
s3ClientV1.setBucketVersioningConfiguration(request);

// SDK V2
// V2 replaces V1's MultiFactorAuthentication POJO with parameters you set on the
// request builder.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutBucketVersioningRequest request = PutBucketVersioningRequest.builder()
    .bucket("bucket-name")
    .versioningConfiguration(VersioningConfiguration.builder()
        .status(BucketVersioningStatus.ENABLED)
        .build())
    .mfa("arn:aws:iam::1234567890:mfa/user 123456") // Single method takes both MFA
    .build();

s3ClientV2.putBucketVersioning(request);
```

Changes in Amazon S3 Transfer Manager from version 1 to version 2

This topic details the changes in the Amazon S3 Transfer Manager from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	<dependencyManagement> <dependencies> <dependency>	<dependencyManagement> <dependencies> <dependency>

Change	v1	v2
	<pre> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.12.691¹</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-s3</ artifactId> </dependency> </dependencies> </pre>	<pre> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.27.21²</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifactId>s3- transfer-manager</art ifactId> </dependency> // Add the following if using the // AWS CRT-based S3 client. <dependency> <groupId> software.amazon.aw ssdk.crt</groupId> <artifact Id>aws-crt</artifa ctId> <version> 0.29.14³</version> </dependency> </dependencies> </pre>

Change	v1	v2
Package name	com.amazonaws.serv ices.s3.transfer	software.amazon.aw ssdk.transfer.s3
Class name	TransferManager	S3TransferManager

¹ [Latest version.](#) ² [Latest version.](#) ³ [Latest version.](#)

Configuration changes

The configuration changes that you need to set for the v2 transfer manager depend on which S3 client that you use. You have the choice of the AWS CRT-based S3 client or the standard Java-based S3 async client. For information about the differences, see the [the section called “S3 clients in the SDK”](#) topic.

Use the AWS CRT-based S3 client

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client
(get a builder)	<pre>TransferManagerBui lder tmBuilder = TransferManagerBui lder.standard();</pre>	<pre>S3TransferManager. Builder tmBuilder = S3TransferManager. builder();</pre>
S3 client	<pre>tmBuilder.withS3Cl ient(...); tmBuilder.setS3C lient(...);</pre>	<pre>tmBuilder.s3Client (...);</pre>
Executor	<pre>tmBuilder.withExec utorFactory(...); tmBuilder.setExecu torFactory(...);</pre>	<pre>tmBuilder.executor (...);</pre>

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client
Shutdown thread pools	<pre>tmBuilder.withShutdownThreadPools(...); tmBuilder.setShutdownThreadPools(...);</pre>	Not supported. The provided executor will not be shut down when the <code>S3TransferManager</code> is closed
Minimum upload part size	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.crtBuilder() .minimumPartSizeInBytes(...) .build(); tmBuilder.s3Client(s3);</pre>
Multipart upload threshold	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.crtBuilder() .thresholdInBytes(...).build(); tmBuilder.s3Client(s3);</pre>
Minimum copy part size	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.crtBuilder() .minimumPartSizeInBytes(...) .build(); tmBuilder.s3Client(s3);</pre>

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client
Multipart copy threshold	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.crtBuilder() .thresholdInBytes(...).build(); tmBuilder.s3Client(s3);</pre>
Disable parallel downloads	<pre>tmBuilder.withDisableParallelDownloads(...); tmBuilder.setDisableParallelDownloads(...);</pre>	Disable parallel downloads by passing a standard Java-based S3 client with multipart disabled (default) to the transfer manager. <pre>S3AsyncClient s3 = S3AsyncClient.builder().build(); tmBuilder.s3Client(s3);</pre>
Always calculate multipart md5	<pre>tmBuilder.withAlwaysCalculateMultipartMd5(...); tmBuilder.setAlwaysCalculateMultipartMd5(...);</pre>	Not supported.

Use Java-based S3 async client

Setting	v1	v2 - Transfer Manager using Java-based S3 async client
(get a builder)	<pre>TransferManagerBuilder tmBuilder = TransferManagerBuilder.standard();</pre>	<pre>S3TransferManager.Builder tmBuilder = S3TransferManager.builder();</pre>
S3 client	<pre>tmBuilder.withS3Client(...); tmBuilder.setS3Client(...);</pre>	<pre>tmBuilder.s3Client(...);</pre>
Executor	<pre>tmBuilder.withExecutorFactory(...); tmBuilder.setExecutorFactory(...);</pre>	<pre>tmBuilder.executor(...);</pre>
Shutdown thread pools	<pre>tmBuilder.withShutdownThreadPools(...); tmBuilder.setShutdownThreadPools(...);</pre>	Not supported. The provided executor will not be shut down when the S3TransferManager is closed
Minimum upload part size	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.builder() .multipartConfiguration(cfg -> cfg.minimumPartSizeInBytes(...)).build(); tmBuilder.s3Client(s3);</pre>

Setting	v1	v2 - Transfer Manager using Java-based S3 async client
Multipart upload threshold	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.builder() .multipartConfiguration(cfg -> cfg.thresholdInBytes(...)). build(); tmBuilder.s3Client(s3);</pre>
Minimum copy part size	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.builder() .multipartConfiguration(cfg -> cfg.minimumPartSizeInBytes(...)).build(); tmBuilder.s3Client(s3);</pre>
Multipart copy threshold	<pre>tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);</pre>	<pre>S3AsyncClient s3 = S3AsyncClient.builder() .multipartConfiguration(cfg -> cfg.thresholdInBytes(...)). build(); tmBuilder.s3Client(s3);</pre>

Setting	v1	v2 - Transfer Manager using Java-based S3 async client
Disable parallel downloads	<pre>tmBuilder.withDisableParallelDownloads(...); tmBuilder.setDisableParallelDownloads(...);</pre>	Disable parallel downloads by passing a standard Java-based S3 client with multipart disabled (default) to the transfer manager. <pre>S3AsyncClient s3 = S3AsyncClient.builder().build(); tmBuilder.s3Client(s3);</pre>
Always calculate multipart md5	<pre>tmBuilder.withAlwaysCalculateMultipartMd5(...); tmBuilder.setAlwaysCalculateMultipartMd5(...);</pre>	Not supported.

Behavior changes

Parallel transfer requirements

In the SDK for Java 2.x, the automatic parallel transfer feature (multipart upload/download) is available through the [AWS CRT-based S3 client](#) and the [Java-based S3 async client](#). To use the AWS CRT-based S3 client, you must explicitly add the [AWS Common Runtime \(CRT\) library](#) dependency for the maximized performance. To use the Java-based S3 async client with multipart enabled, you must use the SDK at version **2.25.X <TODO>** or higher.

The AWS CRT-based S3 client alone—without using `S3TransferManager`—provides maximized performance of parallel transfers. `S3TransferManager` v2 provides additional APIs that make it easier to transfer files and directories.

Parallel download via byte-range fetches

When the automatic parallel transfer feature is enabled, the S3 Transfer Manager v2 uses [byte-range fetches](#) to retrieve specific portions of the object in parallel (multipart download). The way an object is downloaded with v2 does not depend on how the object was originally uploaded. All downloads can benefit from high throughput and concurrency.

In contrast, with S3 Transfer Manager v1, it does matter how the object was originally uploaded. The S3 Transfer Manager v1 retrieves the parts of the object the same way that the parts were uploaded. If an object was originally uploaded as a single object, the S3 Transfer Manager v1 is not able to accelerate the downloading process by using sub-requests.

Failure behavior

With S3 Transfer Manager v1, a directory transfer request fails if any sub-request fails. Unlike v1, the future returned from S3 Transfer Manager v2 completes successfully even if some sub-requests fail.

As a result, you should check for errors in the response by using the [CompletedDirectoryDownload.failedTransfers\(\)](#) method or [CompletedDirectoryUpload.failedTransfers\(\)](#) method even when the future completes successfully.

Changes in parsing Amazon S3 URIs from version 1 to version 2

This topic details the changes in parsing Amazon S3 URIs from version 1 (v1) to version 2 (v2.).

High-level changes

To begin parsing an S3 URI in v1, you instantiate an `AmazonS3URI` by using a constructor. In v2 you call `parseUri()` on an instance of `S3Utilities`, to return an `S3URI`.

Change	v1	v2
Maven dependencies	<pre><dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId></pre>	<pre><dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId></pre>

Change	v1	v2
	<pre><artifactId>aws-java-sdk-bom</artifactId> <version> 1.12.587¹</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>com.amazonaws</groupId> <artifactId>s3</artifactId> </dependency> </dependencies></pre>	<pre><artifactId>bom</artifactId> <version> 2.27.21²</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>software.amazon.awssdk</groupId> <artifactId>s3</artifactId> </dependency> </dependencies></pre>
Package name	com.amazonaws.services.s3	software.amazon.awssdk.services.s3
Class names	AmazonS3URI	S3URI

¹ [Latest version.](#)

² [Latest version.](#)

API changes

Behavior	v1	v2
Parse an S3 URI.	<pre>URI uri = URI.create("https://s3.amazonaws.com"); AmazonS3Uri s3Uri =</pre>	<pre>S3Client s3Client = S3Client.create(); S3Utilities s3Utilities =</pre>

Behavior	v1	v2
	<pre>new AmazonS3URI(uri, false);</pre>	<pre>s3Client.utilities(); S3Uri s3Uri = s3Utilities.parseUri(uri);</pre>
Retrieve the bucket name from an S3 URI.	<pre>String bucket = s3Uri.getBucket();</pre>	<pre>Optional<String> bucket = s3Uri.bucket();</pre>
Retrieve the key.	<pre>String key = s3Uri.getKey();</pre>	<pre>Optional<String> key = s3Uri.key();</pre>
Retrieve the region.	<pre>String region = s3Uri.getRegion();</pre>	<pre>Optional<Region> region = s3Uri.region(); String region; if (s3Uri.region().isPresent()) { region = s3Uri.region().get().id(); }</pre>
Retrieve whether the S3 URI is path style.	<pre>boolean isPathStyle = s3Uri.isPathStyle();</pre>	<pre>boolean isPathStyle = s3Uri.isPathStyle();</pre>
Retrieve the version ID.	<pre>String versionId = s3Uri.getVersionId();</pre>	<pre>Optional<String> versionId = s3Uri.firstMatchingRawQueryParameter("versionId");</pre>

Behavior	v1	v2
Retrieve the query parameter <code>s</code> .	N/A	<pre>Map<String, List<String>> queryParams = s3Uri.rawQueryParameters();</pre>

Behavior changes

URL encoding

v1 provides the option to pass in a flag to specify whether the URI should be URL encoded. The default value is `true`.

In v2, URL encoding is not supported. If you work with object keys or query parameters that have reserved or unsafe characters, you must URL encode them. For example you need to replace a whitespace " " with `%20`.

Changes in the S3 Event Notifications API from version 1 to version 2

This topic details the changes in the S3 Event Notifications API from version 1.x (v1) to version 2.x (v2) of the AWS SDK for Java.

High-level changes

Structural changes

V1 uses static inner classes for `EventNotificationRecord` types and their attributes, whereas v2 uses separate public classes for `EventNotificationRecord` types.

Naming convention changes

In v1, attribute class names include the suffix *Entity*, whereas v2 omits this suffix for simpler naming: for example, *eventData* instead of *eventDataEntity*.

Changes in dependencies, packages and class names

In v1, S3 Event Notification API classes are transitively imported with along with the S3 module (artifactId `aws-java-sdk-s3`). However, in v2, you need to add a dependency on the `s3-event-notifications` artifact.

Change	v1	v2
Maven dependencies	<pre> <dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.X.X</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-s3</ artifactId> </dependency> </dependencies> </pre>	<pre> <dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.X.X¹</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifactId>s3- event-notifications</ artifactId> </dependency> </dependencies> </pre>

API changes

JSON to S3EventNotification and reverse

Use case	v1	v2
Create S3EventNotification from JSON String	<pre>S3EventNotification notification = S3EventNotification.parseJs on(message.body());</pre>	<pre>S3EventNotification notification = S3EventNo tification.fromJso n(message.body());</pre>
Convert S3EventNotification to JSON String	<pre>String json = notification.toJso n();</pre>	<pre>String json = notificat ion.toJson();</pre>

Access attributes of S3EventNotification

Use case	v1	v2
Retrieve records from a notification	<pre>List<S3EventNotification.S3 EventNotificationRecord> records = notificat ion.getRecords();</pre>	<pre>List<S3EventNotifi cationRecord> records = notificat ion.getRecords();</pre>
Retrieve a record from a list of records	<pre>S3EventNotification.S3Event NotificationRecord record = records.stream().findAny(). get();</pre>	<pre>S3EventNotificatio nRecord record = records.s tream().findAny(). get();</pre>
Retrieve Glacier event data	<pre>S3EventNotification.Glacier EventDataEntity glacierEventData = record.getGlacierEventData();</pre>	<pre>GlacierEventData glacierEventData = record.ge tGlacierEventData();</pre>

Use case	v1	v2
Retrieve restore event data from a Glacier event	<pre>S3EventNotification.Restore EventDataEntity restoreEventData = glacierEventData.getRestore EventDataEntity();</pre>	<pre>RestoreEventData restoreEventData = glacierEv entData.getRestore EventData();</pre>
Retrieve request parameters	<pre>S3EventNotification.Request ParametersEntity requestParameters = record.getRequestParameters ();</pre>	<pre>RequestParameters requestParameters = record.ge tRequestParameters();</pre>
Retrieve Intelligent Tiering event data	<pre>S3EventNotification.Intelli gentTieringEventDataEntity tieringEventData = record.getIntelligentTierin gEventData();</pre>	<pre>IntelligentTiering EventData intellige ntTieringEventData = record.ge tIntelligentTierin gEventData();</pre>
Retrieve lifecycle event data	<pre>S3EventNotification.Lifecyc leEventDataEntity lifecycle EventData = record.getLifecycleEventDat a();</pre>	<pre>LifecycleEventData lifecycleEventData = record.ge tLifecycleEventDat a();</pre>
Retrieve event name as enum	<pre>S3Event eventNameAsEnum = record.ge tEventNameAsEnum();</pre>	<pre>//getEventNameAsEnum does not exist; use 'getEventName()' String eventName = record.getEventNam e();</pre>

Use case	v1	v2
Retrieve replication event data	<pre>S3EventNotification.ReplicationEventDataEntity replicationEntity = record.getReplicationEventDataEntity();</pre>	<pre>ReplicationEventData replicationEventData = record.getReplicationEventData();</pre>
Retrieve S3 bucket and object information	<pre>S3EventNotification.S3Entity s3 = record.getS3();</pre>	<pre>S3 s3 = record.getS3();</pre>
Retrieve user identity information	<pre>S3EventNotification.UserIdentityEntity userIdentity = record.getUserIdentity();</pre>	<pre>UserIdentity userIdentity = record.getUserIdentity();</pre>
Retrieve response elements	<pre>S3EventNotification.ResponseElementsEntity responseElements = record.getResponseElements();</pre>	<pre>ResponseElements responseElements = record.getResponseElements();</pre>

Migrate the aws-lambda-java-events library version

If you use [aws-lambda-java-events](#) to work with S3 notification events within a Lambda function, we recommend that you upgrade to the latest 3.x.x version. Recent versions eliminate all dependencies on AWS SDK for Java 1.x from the S3 event notification API.

For more information about the differences in handling S3 event notifications between the aws-lambda-java-events library and the SDK for Java 2.x, see [the section called “S3 event notification handling options”](#).

Profile file changes

The AWS SDK for Java 2.x parses the profile definitions in `~/.aws/config` and `~/.aws/credentials` to more closely emulate the way the AWS CLI parses the files.

The SDK for Java 2.x:

- Resolves a `~/` or `~` followed by the file system's default path separator at the start of the path by checking, in order, `$HOME`, `$USERPROFILE` (Windows only), `$HOMEDRIVE`, `$HOMEPATH` (Windows only), and then the `user.home` system property.
- Looks for the `AWS_SHARED_CREDENTIALS_FILE` environment variable instead of `AWS_CREDENTIAL_PROFILES_FILE`.
- Silently drops profile definitions in configuration files without the word `profile` at the beginning of the profile name.
- Silently drops profile definitions that do not consist of alphanumeric, underscore or dash characters (after the leading `profile` word has been removed for configuration files).
- Merges settings of profile definitions duplicated within the same file.
- Merges settings of profile definitions duplicated in both the configuration and credentials files.
- Does NOT merge settings if both `[profile foo]` and `[foo]` are found in the same file.
- Uses settings in `[profile foo]` if both `[profile foo]` and `[foo]` are found in the configuration file.
- Uses the value of the last duplicated setting in the same file and profile.
- Recognizes both `;` and `#` for defining a comment.
- Recognizes `;` and `#` in profile definitions to define a comment, even if the characters are adjacent to the closing bracket.
- Recognizes `;` and `#` to define a comment only in setting values only if they are preceded by whitespace.
- Recognizes `;` and `#` and all following content in setting values if they are not preceded by whitespace.
- Considers role-based credentials the highest-priority credentials. The 2.x SDK always uses role-based credentials if the user specifies the `role_arn` property.
- Considers session-based credentials the second-highest-priority credentials. The 2.x SDK always uses session-based credentials if role-based credentials were not used and the user specifies the `aws_access_key_id` and `aws_session_token` properties.

- Uses basic credentials if role-based and session-based credentials are not used and the user specified the `aws_access_key_id` property.

Changes in Waiters from version 1 to version 2

This topic details the changes in the functionality of Waiters from version 1 (v1) to version 2 (v2).

The following tables demonstrate the difference for DynamoDB waiters specifically. Waiters for other services follow the same pattern.

High-level changes

Waiters classes are in the same Maven artifact as the service.

Change	v1	v2
Maven dependencies	<pre><dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.12.680<sup>1</sup></version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>dynamodb</artif actId> </dependency> </dependencies></pre>	<pre><dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.27.10<sup>2</sup></version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>dynamodb</artif actId> </dependency> </dependencies></pre>

Change	v1	v2
Package name	<code>com.amazonaws.services.dynamodbv2.waiters</code>	<code>software.amazon.awssdk.services.dynamodb.waiters</code>
Class names	AmazonDynamoDBWaiters	- Synchronous: DynamoDbWaiter - Asynchronous: DynamoDbAsyncWaiter

Change	v1	v2
Create a waiter	<pre>AmazonDynamoDB client = AmazonDynamoDBClientBuilder .standard().build(); AmazonDynamoDBWaiters waiter = client.waiters();</pre>	Synchronous: <pre>DynamoDbClient client = DynamoDbClient.create(); DynamoDbWaiter waiter = client.waiter();</pre> Asynchronous: <pre>DynamoDbAsyncClient asyncClient = DynamoDbAsyncClient.create(); DynamoDbAsyncWaiter waiter = asyncClient.waiter();</pre>
Wait until a table exists	Synchronous: <pre>waiter.tableExists()</pre>	Synchronous:

Change	v1	v2
	<pre data-bbox="613 212 964 401"> .run(new WaiterParameters<>(new DescribeTableRequest(tableName))));</pre> Asynchronous: <pre data-bbox="613 558 980 1703"> waiter.tableExists() .runAsync(new WaiterParameters() .withRequest(new DescribeTableRequest(tableName)), new WaiterHandler() { @Override public void onSuccess(AmazonWebServiceRequest amazonWeb ServiceRequest) { System.out.println("Table creation succeeded"); } @Override public void onFailure(Exception e) { e.printStackTrace(); } }).get();</pre>	<pre data-bbox="1089 233 1440 699"> WaiterResponse<DescribeTableResponse> waiterResponse = waiter.waitForTableExists(r -> r.tableName("myTable")); waiterResponse.matched().response() .ifPresent(System.out::println);</pre> Asynchronous: <pre data-bbox="1089 856 1456 1566"> waiter.waitForTableExists(r -> r.tableName(tableName)) .whenComplete((r, t) -> { if (t != null) { t.printStackTrace(); } else { System.out.println("Table creation succeeded"); } }).join();</pre>

Configuration changes

Change	v1	v2
Polling Strategy (max attempts and fixed delay)	<pre> MaxAttemptsRetryStrategy maxAttemptsRetryStrategy = new MaxAttemptsRetryStrategy(10); FixedDelayStrategy fixedDelayStrategy = new FixedDelayStrategy(3); PollingStrategy pollingStrategy = new PollingStrategy(maxAttemptsRetryStrategy, fixedDelayStrategy); waiter.tableExists().run(new WaiterParameters<>(new DescribeTableRequest(tableName), pollingStrategy); </pre>	<pre> FixedDelayBackoffStrategy fixedDelayBackoffStrategy = FixedDelayBackoffStrategy.create(Duration.ofSeconds(3)); waiter.waitUntilTableExists(r -> r.tableName(tableName), c -> c.maxAttempts(10) .backoffStrategy(fixedDelayBackoffStrategy)); </pre>

Changes in the EC2 metadata utility from version 1 to version 2

This topic details the changes in the SDK for Java Amazon Elastic Compute Cloud (EC2) metadata utility from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	<pre><dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.12.587¹</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-co re</artifactId> </dependency> </dependencies></pre>	<pre><dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.27.21²</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>imds</artifactId> </dependency> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>apache-client³</ artifactId> </dependency> </dependencies></pre>

Change	v1	v2
Package name	<code>com.amazonaws.util</code>	<code>software.amazon.awssdk.imds</code>
Instantiation approach	Use static utility methods; no instantiation: <pre>String localHostName = EC2MetadataUtils.getLocalHostName();</pre>	Use a static factory method: <pre>Ec2MetadataClient client = Ec2MetadataClient.create();</pre> Or use a builder approach: <pre>Ec2MetadataClient client = Ec2MetadataClient.builder() .endpointMode(EndpointMode.IPV6) .build();</pre>
Types of clients	Synchronous only utility methods: <code>EC2MetadataUtils</code>	Synchronous: <code>Ec2MetadataClient</code> Asynchronous: <code>Ec2MetadataAsyncClient</code>

¹ [Latest version.](#) ² [Latest version.](#)

³Notice the declaration of the `apache-client` module for v2. V2 of the EC2 metadata utility requires an implementation of the `SdkHttpClient` interface for the synchronous metadata client, or the `SdkAsyncHttpClient` interface for the asynchronous metadata client. The [??? section](#) shows the list of HTTP clients that you can use.

Requesting metadata

In v1, you use static methods that accept no parameters to request metadata for an EC2 resource. In contrast, you need to specify the path to the EC2 resource as a parameter in v2. The following table shows the different approaches.

v1	v2
<pre>String userMetaDatum = EC2MetadataUtils.getUserData();</pre>	<pre>Ec2MetadataClient client = Ec2MetadataClient.create(); Ec2MetadataResponse response = client.get("/latest/user-data"); String userMetaDatum = response.asString();</pre>

Refer to the [instance metadata categories](#) to find the path you need to supply to request a piece of metadata.

 **Note**

When you use an instance metadata client in v2, you should aim to use the same client for all request to retrieve metadata.

Behavior changes

JSON data

On EC2, the locally running Instance Metadata Service (IMDS) returns some metadata as JSON formatted strings. One such example is the dynamic metadata of an [instance identity document](#).

The v1 API contains separate methods for each piece of instance identity metadata, whereas the v2 API directly returns the JSON string. To work with the JSON string, you can use the [Document API](#) to parse the response and navigate the JSON structure.

The following table compares how you retrieve metadata of an instance identity document in v1 and v2.

Use case	v1	v2
Retrieve the Region	<pre>InstanceInfo instanceInfo =</pre>	<pre>Ec2MetadataResponse response =</pre>

Use case	v1	v2
	<pre> EC2MetadataUtils.getInstanceInfo(); String region = instanceInfo.getRegion(); </pre>	<pre> client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String region = instanceInfo.asMap().get("region").asString(); </pre>
Retrieve the instance id	<pre> InstanceInfo instanceInfo = EC2MetadataUtils.getInstanceInfo(); String instanceId = instanceInfo.getInstanceId(); </pre>	<pre> Ec2MetadataResponse response = client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String instanceId = instanceInfo.asMap().get("instanceId").asString(); </pre>
Retrieve the instance type	<pre> InstanceInfo instanceInfo = EC2MetadataUtils.getInstanceInfo(); String instanceType = instanceInfo.getInstanceType(); </pre>	<pre> Ec2MetadataResponse response = client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String instanceType = instanceInfo.asMap().get("instanceType").asString(); </pre>

Endpoint resolution differences

The following table shows the locations that the SDK checks to resolve the endpoint to IMDS. The locations are listed in descending priority.

v1	v2
System property: <code>com.amazonaws.sdk.ec2MetadataServiceEndpointOverride</code>	Client builder configuration method: <code>endpoint(...)</code>
Environment variable: <code>AWS_EC2_METADATA_SERVICE_ENDPOINT</code>	System property: <code>aws.ec2MetadataServiceEndpoint</code>
Default Value: <code>http://169.254.169.254</code>	Config file: <code>~/.aws/config</code> with the <code>ec2_metadata_service_endpoint</code> setting
	Value associated with resolved endpoint-mode
	Default value: <code>http://169.254.169.254</code>

Endpoint resolution in v2

When you explicitly set an endpoint by using the builder, that endpoint value takes priority over all other settings. When the following code executes, the `aws.ec2MetadataServiceEndpoint` system property and config file `ec2_metadata_service_endpoint` setting are ignored if they exist.

```
Ec2MetadataClient client = Ec2MetadataClient
    .builder()
    .endpoint(URI.create("endpoint.to.use"))
    .build();
```

Endpoint-mode

With v2, you can specify an endpoint-mode to configure the metadata client to use the default endpoint values for IPv4 or IPv6. Endpoint-mode is not available for v1. The default value used for IPv4 is `http://169.254.169.254` and `http://[fd00:ec2::254]` for IPv6.

The following table shows the different ways that you can set the endpoint mode in order of descending priority.

		Possible values
Client builder configuration method: <code>endpointMode(...)</code>	<pre>Ec2MetadataClient client = Ec2MetadataClient .builder() .endpointMode(EndpointMode.IPV4) .build();</pre>	<code>EndpointMode.IPV4</code> , <code>EndpointMode.IPV6</code>
System property	<code>aws.ec2MetadataServiceEndpointMode</code>	IPv4, IPv6 (case does not matter)
Config file: <code>~/.aws/config</code>	<code>ec2_metadata_service_endpoint_mode</code> setting	IPv4, IPv6 (case does not matter)
Not specified in the previous ways	IPv4 is used	

How the SDK resolves endpoint or endpoint-mode in v2

1. The SDK uses the value that you set in code on the client builder and ignores any external settings. Because the SDK throws an exception if both `endpoint` and `endpointMode` are called on the client builder, the SDK uses the endpoint value from whichever method you use.
2. If you do not set a value in code, the SDK looks to external configuration—first for system properties and then for a setting in the config file.
 - a. The SDK first checks for an endpoint value. If a value is found, it is used.
 - b. If the SDK still hasn't found a value, the SDK looks for endpoint mode settings.

3. Finally, if the SDK finds no external settings and you have not configured the metadata client in code, the SDK uses the IPv4 value of `http://169.254.169.254`.

IMDSv2

Amazon EC2 defines two approaches to access instance metadata:

- Instance Metadata Service Version 1 (IMDSv1) – Request/response approach
- Instance Metadata Service Version 2 (IMDSv2) – Session-oriented approach

The following table compares how the Java SDKs work with IMDS.

v1	v2
IMDSv2 is used by default	Always uses IMDSv2
Attempts to fetch a session token for each request and falls back to IMDSv1 if it fails to fetch a session token	Keeps a session token in an internal cache that is reused for multiple requests

The SDK for Java 2.x supports only IMDSv2 and does not fall back to IMDSv1.

Configuration differences

The following table lists the differing configuration options.

Configuration	v1	v2
Retries	Configuration not available	Configurable through builder method <code>retryPolicy(...)</code>
HTTP	Connection timeout configurable through the <code>AWS_METADATA_SERVICE_TIMEOUT</code> environment variable. The default is 1 second.	Configuration available by passing an HTTP client to the builder method <code>httpClient(...)</code> . The default

Configuration	v1	v2
		connection timeout for HTTP clients is 2 seconds.

Example v2 HTTP configuration

The following example shows how you can configure the metadata client. This example configures the connection timeout and uses the Apache HTTP client.

```
SdkHttpClient httpClient = ApacheHttpClient.builder()
    .connectionTimeout(Duration.ofSeconds(1))
    .build();

Ec2MetadataClient imdsClient = Ec2MetadataClient.builder()
    .httpClient(httpClient)
    .build();
```

Changes in Amazon CloudFront presigning from version 1 to version 2

This topic details the changes in the Amazon CloudFront from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2

	<pre> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>cloudfront</art ifactId> </dependency> </dependencies> </pre>	<pre> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>cloudfront</art ifactId> </dependency> </dependencies> </pre>
Package name	com.amazonaws.serv ices.cloudfront	software.amazon.aw ssdk.services.clou dfront
Class names	CloudFrontUrlSigner CloudFrontCookieSigner	CloudFrontUtilities SignedUrl CannedSignerRequest CustomSignerRequest

¹ [Latest version.](#) ² [Latest version.](#)

API changes

Behavior	v1	v2
Build a canned request	Arguments are passed directly to the API.	<pre> CannedSignerRequest cannedRequest = CannedSig nerRequest.builder() </pre>

Behavior	v1	v2
		<pre> .resourceUrl(resourceUrl) .privateKey(privateKey) .keyPairId(keyPairId) .expirationDate(expirationDate) .build();</pre>
Build a custom request	Arguments are passed directly to the API.	<pre>CustomSignerRequest customRequest = CustomSignerRequest.builder() .resourceUrl(resourceUrl) .resourceUrlPattern(resourceUrlPattern) .privateKey(keyFile) .keyPairId(keyPairId) .expirationDate(expirationDate) .activeDate(activeDate) .ipRange(ipRange) .build();</pre>

Behavior	v1	v2
Generate a signed URL (canned)	<pre>String signedUrl = CloudFrontUrlSigner.getSignedURLWith CannedPolicy(resourceUrl, keyPairId, privateKey, expirationDate);</pre>	<pre>CloudFrontUtilities cloudFrontUtilities = CloudFrontUtilities.create(); SignedUrl signedUrl = cloudFrontUtilities.getSignedUrlWith CannedPolicy(cannedRequest); String url = signedUrl.url();</pre>
Generate a signed cookie (custom)	<pre>CookiesForCustomPolicy cookies = CloudFrontCookieSigner.getCookiesFor CustomPolicy(resourceUrl, privateKey, keyPairId, expirationDate, activeDate, ipRange);</pre>	<pre>CloudFrontUtilities cloudFrontUtilities = CloudFrontUtilities.create(); CookiesForCustomPolicy cookies = cloudFrontUtilities.getCookiesForCustomPolicy(customRequest);</pre>

Refactored cookie headers in v2

In Java v1, the Java SDK delivers cookie headers as a `Map.Entry<String, String>`.

```
Map.Entry<String, String> signatureMap = cookies.getSignature();
String signatureKey = signatureMap.getKey(); // "CloudFront-Signature"
String signatureValue = signatureMap.getValue(); // "[SIGNATURE_VALUE]"
```

The Java v2 SDK delivers the entire header as a single `String`.

```
String signatureHeaderValue = cookies.signatureHeaderValue(); // "CloudFront-
Signature=[SIGNATURE_VALUE]"
```

Changes in the IAM Policy Builder API from version 1 to version 2

This topic details the changes in the IAM Policy Builder API from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	<pre><dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.12.587<sup>1</sup></version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-co re</artifactId> </dependency> </dependencies> </dependencies></pre>	<pre><dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.27.21<sup>2</sup></version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>iam-policy-buil der</artifactId> </dependency> </dependencies></pre>

¹ [Latest version.](#) ² [Latest version.](#)

API changes

Setting	v1	v2
Instantiate a policy	<pre>Policy policy = new Policy();</pre>	<pre>IamPolicy.Builder policyBuilder = IamPolicy.builder(); ... IamPolicy policy = policyBuilder.buil d();</pre>
Set id	<pre>policy.withtId(...); policy.setId(...);</pre>	<pre>policyBuilder.id(...);</pre>

Setting	v1	v2
Set version	N/A - uses default version of 2012-10-17	policyBuilder.version(...);
Create statement	Statement statement = new Statement (Effect.Allow) .withActions(...) .withConditions(...) .withId(...) .withPrincipals(...) .withResources(...);	IamStatement statement = IamStatement.builder() .effect(IamEffect.ALLOW) .actions(...) .notActions(...) .conditions(...) .sid(...) .principals(...) .notPrincipals(...) .resources(...) .notResources(...) .build();
Set statement	policy.withStatements(statement); policy.setStatements(statement);	policyBuilder.addStatement(statement);

Differences in building a statement

Actions

v1

The v1 SDK has [enum types](#) for service actions that represent [Action](#) elements in a policy statement. The following enum types are some examples.

- [IdentityManagementActions](#)
- [DynamoDBv2Actions](#)
- [SQSActions](#)

The following example shows the `SendMessage` constant for `SQSActions`.

```
Action action = SQSActions.SendMessage;
```

You cannot specify a [NotAction](#) element to a statement in v1.

v2

In v2, the [IamAction](#) interface represents all actions. To specify a [service-specific action](#) element, pass a string to the `create` method as shown in the following code.

```
IamAction action = IamAction.create("sqs:SendMessage");
```

You can specify a [NotAction](#) for a statement with v2 as shown in the following code.

```
IamAction action = IamAction.create("sqs:SendMessage");  
IamStatement.builder().addNotAction(action);
```

Conditions

v1

To represent statement conditions, the v1 SDK uses subclasses of [Condition](#).

- [ArnCondition](#)

- [BooleanCondition](#)
- [DateCondition](#)
- [IpAddressCondition](#)
- [NumericCondition](#)
- [StringCondition](#)

Each Condition subclass defines a comparison enum type to help define the condition. For example, the following shows a *not like* [string comparison](#) for a condition.

```
Condition condition = new StringCondition(StringComparisonType.StringNotLike, "key", "value");
```

v2

In v2, you build a condition for a policy statement by using [IamCondition](#) and provide an [IamConditionOperator](#), which contains enums for all types.

```
IamCondition condition = IamCondition.create(IamConditionOperator.STRING_NOT_LIKE, "key", "value");
```

Resources

v1

A policy statement's [Resource](#) element is represented by the SDK's [Resource](#) class. You supply the ARN as a string in the constructor. The following subclasses provide convenience constructors.

- [S3BucketResource](#)
- [S3ObjectResource](#)
- [SQSQueueResource](#)

In v1, you can specify a [NotResource](#) element for a [Resource](#) by calling the `withIsNotType` method as shown in the following statement.

```
Resource resource = new Resource("arn:aws:s3:::mybucket").withIsNotType(true);
```

v2

In v2, you create a [Resource](#) element by passing an ARN to the `IamResource.create` method.

```
IamResource resource = IamResource.create("arn:aws:s3:::mybucket");
```

An [IamResource](#) can be set as [NotResource](#) element as shown in the following snippet.

```
IamResource resource = IamResource.create("arn:aws:s3:::mybucket");  
IamStatement.builder().addNotResource(resource);
```

`IamResource.ALL` represents all resources.

Principals

v1

The v1 SDK offers the following [Principal](#) classes to represent types of principals that include all members:

- `AllUsers`
- `AllServices`
- `AllWebProviders`
- `All`

You cannot add a [NotPrincipal](#) element to a statement.

v2

In v2, `IamPrincipal.ALL` represents all principals:

To represent all members in other types of principals, use the [IamPrincipalType](#) classes when you create a `IamPrincipal`.

- `IamPrincipal.create(IamPrincipalType.AWS, "*")` for all users.
- `IamPrincipal.create(IamPrincipalType.SERVICE, "*")` for all services.
- `IamPrincipal.create(IamPrincipalType.FEDERATED, "*")` for all web providers.

- `IamPrincipal.create(IamPrincipalType.CANONICAL_USER, "*")` for all canonical users.

You can use the `addNotPrincipal` method to represent a [NotPrincipal](#) element when you create a policy statement as shown in the following statement.

```
IamPrincipal principal = IamPrincipal.create(IamPrincipalType.AWS,
    "arn:aws:iam::444455556666:root");
IamStatement.builder().addNotPrincipal(principal);
```

Changes in the DynamoDB mapping/document APIs from version 1 to version 2

This topic details the changes in the Java SDK's high-level APIs for Amazon DynamoDB from version 1.x (v1) to the AWS SDK for Java 2.x (v2). We first cover the object-to-table mapping API and then discuss the [document API](#) for working with JSON-style documents.

High-level changes

The names of the mapping client in each library differ in v1 and v2:

- v1 - `DynamoDBMapper`
- v2 - `DynamoDB Enhanced Client`

You interact with the two libraries in much the same way: you instantiate a mapper/client and then supply a Java POJO to APIs that read and write these items to DynamoDB tables. Both libraries also offer annotations for the class of the POJO to direct how the client handles the POJO.

Notable differences when you move to v2 include:

- V2 and v1 use different method names for the low-level DynamoDB operations. For example:

v1	v2
load	getItem
save	putItem
batchLoad	batchGetItem

- V2 offers multiple ways to define table schemas and map POJOs to tables. You can choose from the use of annotations or a schema generated from code using a builder. V2 also offers mutable and immutable versions of schemas.
- With v2, you specifically create the table schema as one of the first steps, whereas in v1, the table schema is inferred from the annotated class as needed.
- V2 includes the [Document API client](#) in the enhanced client API, whereas v1 uses a [separate API](#).
- All APIs are available in synchronous and asynchronous versions in v2.

See the [DynamoDB mapping section](#) in this guide for more detailed information on the v2 enhanced client.

Import dependencies

v1	v2
<pre> <dependencyManagement> <dependencies> <dependency> <groupId>com.amazonaws</gro upId> <artifactId>aws-java-sdk-bom</ artifactId> <version> 1.X.X</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>com.amazonaws</groupId> <artifactId>aws-java-sdk-dy namodb</artifactId> </dependency> </dependencies> </pre>	<pre> <dependencyManagement> <dependencies> <dependency> <groupId>software.amazon.aw ssdk</groupId> <artifactId>bom</artifactId> <version> 2.X.X*</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>software.amazon.aw ssdk</groupId> <artifactId>dynamodb-enhanced</ artifactId> </dependency> </dependencies> </pre>

* [Latest version](#).

In v1, a single dependency includes both the low-level DynamoDB API and the mapping/document API, whereas in v2, you use the dynamodb-enhanced artifact dependency to access the mapping/document API. The dynamodb-enhanced module contains a transitive dependency on the low-level dynamodb module.

API changes

Create a client

Use case	v1	v2
Normal instantiation	<pre>AmazonDynamoDB standardClient = AmazonDynamoDBClientBuilder.standard() .withCredentials(credentialsProvider) .withRegion(Regions.US_EAST_1) .build(); DynamoDBMapper mapper = new DynamoDBMapper(standardClient);</pre>	<pre>DynamoDbClient standardClient = DynamoDbClient.builder() .credentialsProvider(ProfileCredentialsProvider.create()) .region(Regions.US_EAST_1) .build(); DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.builder() .dynamoDbClient(standardClient) .build();</pre>
Minimal instantiation	<pre>AmazonDynamoDB standardClient = AmazonDynamoDBClientBuilder.standard(); DynamoDBMapper mapper = new DynamoDBMapper(standardClient);</pre>	<pre>DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.create();</pre>
With attribute transformer [*]	<pre>DynamoDBMapper mapper = new DynamoDBMapper(standardClient,</pre>	<pre>DynamoDbEnhancedClient enhancedClient</pre>

Use case	v1	v2
	<pre>attributeTransformerInstance);</pre>	<pre>= DynamoDbEnhancedClient.builder() .dynamoDbClient(standardClient) .extensions(extensionAInstance, extensionBInstance) .build();</pre>

*Extensions in v2 correspond roughly to attribute transformers in v1. The [the section called “Use extensions”](#) section contains more information on extensions in v2.

Establish mapping to DynamoDB table/index

In v1, you specify a DynamoDB table name through a bean annotation. In v2, a factory method, `table()`, produces an instance of `DynamoDbTable` that represents the remote DynamoDB table. The first parameter of the `table()` method is the DynamoDB table name.

Use case	v1	v2
Map the Java POJO class to the DynamoDB table	<pre>@DynamoDbTable(tableName = "Customer") public class Customer { ... }</pre>	<pre>DynamoDbTable<Customer> customerTable = enhancedClient.table("Customer", TableSchema.fromBean(Customer.class));</pre>
Map to a DynamoDB secondary index	- Define a POJO class that represents the index. - Annotate class with the <code>@DynamoDbTable</code> supplying the name of the table that has the index. - Annotate properties with <code>@DynamoDBIndexHash</code>	Annotate attributes of a POJO class with <code>@DynamoDbSecondaryPartitionKey</code> (for a GSI) and <code>@DynamoDbSecondarySortKey</code> (for and GSI or LSI). For example,

Use case	v1	v2
	Key and optionally <code>@DynamoDBIndexRangeKey</code>. 2. Create a query expression. 3. Query using reference to the POJO class that represents the index. For example <pre>mapper.query(IdEmailIndex.class, queryExpression)</pre> where <code>IdEmailIndex</code> is the mapping class for the index. The section in the DynamoDB Developer Guide that discusses the v1 query method shows a complete example.	<pre>@DynamoDbSecondarySortKey(indexNames = "IdEmailIndex") public String getEmail() { return this.email; }</pre> 2. Retrieve a reference to the index. For example, <pre>DynamoDbIndex<Customer> customerIndex = customerTable.index("IdEmailIndex");</pre> 3. Query the index. The ??? section in this guide provides more information.

Table operations

This section describes operation APIs that differ between v1 and v2 for most standard use cases.

In v2, all operations that involve a single table are called on the `DynamoDbTable` instance, not on the enhanced client. The enhanced client contains methods that can target multiple tables.

In the table named *Table operations* below, a POJO instance is referred to as `item` or as a specific type such as `customer1`. For the v2 examples the instances named, `table` is the result of previously calling `enhancedClient.table()` that returns a reference to the `DynamoDbTable` instance.

Note that most v2 operations can be called with a fluent consumer pattern even when not shown. For example,

```
Customer customer = table.getItem(r # r.key(key));
    or
Customer customer = table.getItem(r # r.key(k ->
    k.partitionValue("id").sortValue("email")))
```

For v1 operations, the table contains some of the commonly used forms and not all overloaded forms. For example, the load() method has the following overloads:

```
mapper.load(Customer.class, hashKey)
mapper.load(Customer.class, hashKey, rangeKey)
mapper.load(Customer.class, hashKey, config)
mapper.load(Customer.class, hashKey, rangeKey, config)
mapper.load(item)
mapper.load(item, config)
```

The table shows the commonly used forms:

```
mapper.load(item)
mapper.load(item, config)
```

Table operations

Use case	v1	Dynam v2	operat
Write a Java POJO to a Dynam table	<pre>mapper.save(item) mapper.save(item, config) mapper.save(item, saveExpression, config)</pre> In v1, DynamoDBMapperConfig.SaveBehavior and annotations determines which low-level DynamoDB method will be called. In	PutItem Update m	<pre>table.putItem(putItemRequest) table.putItem(item) table.putItemWithResponse(item) // Returns metadata. updateItem(updateItemRequest) table.updateItem(item) table.updateItemWithResponse(item) //Returns metadata.</pre>

Use case	v1	Dynam v2	operat
	general, UpdateItem is called except when using SaveBehavior.CLOBBER and SaveBehavior.PUT . Auto-generated keys are a special use case, and occasionally both PutItem and UpdateItem are used.		
Read an item from a Dynam table to a Java POJO	<pre>mapper.load(item) mapper.load(item, config)</pre>	GetIt	<pre>table.getItem(getItemRequest) table.getItem(item) table.getItem(key) table.getItemWithResponse(key) // Returns POJO with metadata.</pre>
Delete an item from a Dynam table	<pre>mapper.delete(item , deleteExpression, config)</pre>	Delet m	<pre>table.deleteItem(deleteItemRequest) table.deleteItem(item) table.deleteItem(key)</pre>

Use case	v1	Dynam v2	operat
Query a Dyna table or secon index and return a pagina list	<pre>mapper.query(Customer.class, queryExpression) mapper.query(Customer.class, queryExpression, mapperConfig)</pre>	Query	<pre>table.query(queryRequest) table.query(queryConditional)</pre> Use the returned <code>PageIterable.stream()</code> (lazy loading) for sync responses and <code>PagePublisher.subscribe()</code> for async responses
Query a Dyna table or secon index and return a list	<pre>mapper.queryPage(Customer.class, queryExpression) mapper.queryPage(Customer.class, queryExpression, mapperConfig)</pre>	Query	<pre>table.query(queryRequest) table.query(queryConditional)</pre> Use the returned <code>PageIterable.items()</code> (lazy loading) for sync responses and <code>PagePublisher.items.subscribe()</code> for async responses

Use case	v1	Dynam operat	v2
Scan a Dynamo table or second index and return a paginated list	<pre>mapper.scan(Customer.class, scanExpression) mapper.scan(Customer.class, scanExpression, mapperConfig)</pre>	Scan	<pre>table.scan() table.scan(scanRequest)</pre> Use the returned <code>PageIterable.stream()</code> (lazy loading) for sync responses and <code>PagePublisher.subscribe()</code> for async responses
Scan a Dynamo table or second index and return a list	<pre>mapper.scanPage(Customer.class, scanExpression) mapper.scanPage(Customer.class, scanExpression, mapperConfig)</pre>	Scan	<pre>table.scan() table.scan(scanRequest)</pre> Use the returned <code>PageIterable.items()</code> (lazy loading) for sync responses and <code>PagePublisher.items.subscribe()</code> for async responses

Use case	v1	Dynam v2 operat
Read multip items from multip tables in a batch	<pre>mapper.batchLoad(Arrays.asList(customer1, customer2, book1)) mapper.batchLoad(itemsToGet) // itemsToGet: Map<Class<?>, List<KeyPair>></pre>	Batch tem <pre>enhancedClient.batchGetItem(batchGetItemRequest) enhancedClient.batchGetItem(r -> r.readBatches(ReadBatch.builder(Record1.class) .mappedTableResource(mappedTable1) .addGetItem(i -> i.key(k -> k.partitionValue(0))) .build(), ReadBatch.builder(Record2.class) .mappedTableResource(mappedTable2) .addGetItem(i -> i.key(k -> k.partitionValue(0))) .build())) // Iterate over pages with lazy loading or over all items from the same table.</pre>

Use case	v1	Dynam v2	operat
Write multiple items to multiple tables in a batch	<pre>mapper.batchSave(Arrays.asList(customer1, customer2, book1))</pre>	BatchWriteItem	<pre>enhancedClient.batchWriteItem(batchWriteItemRequest) enhancedClient.batchWriteItem(r -> r.writeBatches(WriteBatch.builder(Record1.class) .mappedTableResource(mappedTable1) .addPutItem(item1) .build(), WriteBatch.builder(Record2.class) .mappedTableResource(mappedTable2) .addPutItem(item2) .build()))</pre>
Delete multiple items from multiple tables in a batch	<pre>mapper.batchDelete(Arrays.asList(customer1, customer2, book1))</pre>	BatchWriteItem	<pre>enhancedClient.batchWriteItem(r -> r.writeBatches(WriteBatch.builder(Record1.class) .mappedTableResource(mappedTable1) .addDeleteItem(item1key) .build(), WriteBatch.builder(Record2.class) .mappedTableResource(mappedTable2) .addDeleteItem(item2key) .build()))</pre>

Use case	v1	Dynam operat	v2
Write/ del ete multip items in a batch	<pre>mapper.batchWrite(Arrays.asList(customer1, book1), Arrays.asList(customer2))</pre>	Batch eItem	<pre>enhancedClient.batchWriteItem(r -> r.writeBatches(WriteBatch.builder(Record1.class) .mappedTableResource(mappedTable1) .addPutItem(item1) .build(), WriteBatch.builder(Record2.class) .mappedTableResource(mappedTable2) .addDeleteItem(item2key) .build()))</pre>
Carry out a transac tional write	<pre>mapper.transactionWrite(transactionWriteRequest)</pre>	Trans riteI	<pre>enhancedClient.transactWriteItems(transactWriteItemsRequest)</pre>
Carry out a transac tional read	<pre>mapper.transactionLoad(transactionLoadRequest)</pre>	Trans etIte	<pre>enhancedClient.transactGetItems(transactGetItemsRequest)</pre>

Use case	v1	Dynam operat	v2
Get count of matching items of a scan or query	<pre>mapper.count(Customer.class, queryExpression) mapper.count(Customer.class, scanExpression)</pre>	Query, Scan with Select, UNT	Not supported
Create a table in Dynam corres ding to the POJO class	<pre>mapper.generateCreateTableRequest(Customer.class)</pre> The previous statement generates a low-level create table request; users must call <code>createTable</code> on the <code>DynamoDB</code> client.	Create	<pre>table.createTable(createTableRequest) table.createTable(r -> r.provisionedThroughput(getDefaultProvisionedThroughput()) .globalSecondaryIndices(EnhancedGlobalSecondaryIndex.builder() .indexName("gsi_1") .projection(p -> p.projectionType(ProjectionType.ALL)) .provisionedThroughput(getDefaultProvisionedThroughput()) .build()));</pre>

Use case	v1	Dynam v2 operat	v2
Perform a parallel scan in Dynam	<pre>mapper.parallelScan(Customer.class, scanExpression, numTotalSegments)</pre>	Scan with Segments and Total elements parameters	Users are required to handle the worker threads and call scan for each segment: <pre>table.scan(r -> r.segment(0).totalSegments(5))</pre>
Integrate Amazon S3 with Dynam to store intelligent S3 links	<pre>mapper.createS3Link(bucket, key) mapper.getS3ClientCache()</pre>	-	Not supported because it couples Amazon S3 and DynamoDB.

Map classes and properties

In both v1 and v2, you map classes to tables using bean-style annotations. V2 also offers [other ways to define schemas](#) for specific use cases, such as working with immutable classes.

Bean annotations

The following table shows the equivalent bean annotations for a specific use case that are used in v1 and v2. A `Customer` class scenario is used to illustrate parameters.

Annotations—as well as classes and enumerations—in v2 follow camel case convention and use 'DynamoDb', not 'DynamoDB'.

Use case	v1	v2
Map class to table	<pre>@DynamoDBTable (tableName ="CustomerTable")</pre>	<pre>@DynamoDbBean @dynamoDbBean(converterProviders = {...})</pre> The table name is defined when calling the <code>DynamoDbEnhancedClient#table()</code> method.
Designate a class member as a table attribute	<pre>@DynamoDBAttribute (attributeName = "customerName")</pre>	<pre>@DynamoDbAttribute("customerName")</pre>
Designate a class member is a hash/partition key	<pre>@DynamoDBHashKey</pre>	<pre>@DynamoDbPartitionKey</pre>
Designate a class member is a range/sort key	<pre>@DynamoDBRangeKey</pre>	<pre>@DynamoDbSortKey</pre>
Designate a class member is a secondary index hash/partition key	<pre>@DynamoDBIndexHash Key</pre>	<pre>@DynamoDbSecondaryPartitionKey</pre>

Use case	v1	v2
Designate a class member is a secondary index range/sort key	<code>@DynamoDBIndexRangeKey</code>	<code>@DynamoDbSecondarySortKey</code>
Ignore this class member when mapping to a table	<code>@DynamoDBIgnore</code>	<code>@DynamoDbIgnore</code>
Designate a class member as an auto-generated UUID key attribute	<code>@DynamoDBAutoGeneratedKey</code>	<code>@DynamoDbAutoGeneratedUuid</code> The extension that provides this is not loaded by default; you must add the extension to client builder.
Designate a class member as an auto-generated timestamp attribute	<code>@DynamoDBAutoGeneratedTimestamp</code>	<code>@DynamoDbAutoGeneratedTimestampAttribute</code> The extension that provides this is not loaded by default; you must add the extension to client builder.

Use case	v1	v2
Designate a class member as an auto-incremented version attribute	@DynamoDBVersionAttribute	@DynamoDbVersionAttribute The extension that provides this is auto-loaded.
Designate a class member as requiring a custom conversion	@DynamoDBTypeConverted	@DynamoDbConvertedBy
Designate a class member to be stored as a different attribute type	@DynamoDBTyped(<DynamoDBAttributeType>)	No equivalent
Designate a class that can be serialized to a DynamoDB document (JSON-style document) or sub-document	@DynamoDBDocument	No direct equivalent annotation. Use the Enhanced Document API.

V2 additional annotations

Use case	v1	v2
Designate a class member not to be stored as a NULL attribute if the Java value is null	N/A	<code>@DynamoDbIgnoreNulls</code>
Designate a class member to be an empty object if all attributes are null	N/A	<code>@DynamoDbPreserveEmptyObject</code>
Designate special update action for a class member	N/A	<code>@DynamoDbUpdateBehavior</code>
Designate an immutable class	N/A	<code>@DynamoDbImmutable</code>
Designate a class member as an auto-incremented counter attribute	N/A	<code>@DynamoDbAtomicCounter</code> The extension that provides this functionality is auto-loaded.

Configuration

In v1, you generally control specific behaviors by using an instance of `DynamoDBMapperConfig`. You can supply the configuration object either when you create the mapper or when you make a request. In v2, configuration is specific to the request object for the operation.

Use case	v1	Default in v1	v2
	<code>DynamoDBMapperConfig.builder()</code>		

Use case	v1	Default in v1	v2
Batch load retry strategy	<code>.withBatchLoadRetryStrategy(batchLoadRetryStrategy)</code>	retry failed items	
Batch write retry strategy	<code>.withBatchWriteRetryStrategy(batchWriteRetryStrategy)</code>	retry failed items	
Consistent reads	<code>.withConsistentReads(CONSISTENT)</code>	EVENTUAL	By default, consistent reads is false for read operations. Override with <code>.consistentRead(true)</code> on the request object.
Conversion schema with sets of marshallers/unmarshallers	<code>.withConversionSchema(conversionSchema)</code> Static implementations provide backwards compatibility with older versions.	V2_COMPATIBLE	Not applicable. This is a legacy feature that refers to how the earliest versions of DynamoDB (v1) stored data types, and this behavior will not be preserved in the enhanced client. An example of behavior in DynamoDB v1 is storing booleans as Number instead of as Boolean.

Use case	v1	Default in v1	v2
Table names	<pre> .withObjectTableNameResolver() .withTableNameOverride() .withTableNameResolver() </pre> Static implementations provide backwards compatibility with older versions	use annotation or guess from class	The table name is defined when calling the <code>DynamoDbEnhancedClient#table()</code> method.
Pagination load strategy	<pre> .withPaginationLoadingStrategy(strategy) </pre> Options are: LAZY_LOADING, EAGER_LOADING , or ITERATION_ONLY	LAZY_LOADING	Iteration only is the default. The other v1 options are not supported.
Request metric collection	<pre> .withRequestMetricCollector(collector) </pre>	null	Use <code>metricPublisher()</code> in <code>ClientOverrideConfiguration</code> when building the standard DynamoDB client.

Use case	v1	Default in v1	v2
Save behavior	<pre>.withSaveBehavior(SaveBehavior.CLOBBER)</pre> Options are UPDATE, CLOBBER, PUT, APPEND_SET , or UPDATE_SKIP_NULL_ATTRIBUTES .	UPDATE	In v2, you call <code>putItem()</code> or <code>updateItem()</code> explicitly. CLOBBER or PUT: Corresponding action in v2 is calling <code>putItem()</code> . There is no specific CLOBBER configuration. UPDATE: Corresponds to <code>updateItem()</code> UPDATE_SKIP_NULL_ATTRIBUTES : Corresponds to <code>updateItem()</code> . Control update behavior with the request setting <code>ignoreNulls</code> and the annotation/tag <code>DynamoDbUpdateBehavior</code> . APPEND_SET : Not supported
Type converter factory	<pre>.withTypeConverterFactory(typeConverterFactory)</pre>	standard type converters	Set on the bean by using <pre>@DynamoDbBean(converterProviders = {ConverterProvider.class, DefaultAttributeConverterProvider.class})</pre>

Per-operation configuration

In v1, some operations, such as `query()`, are highly configurable through an “expression” object submitted to the operation. For example:

```
DynamoDBQueryExpression<Customer> emailBwQueryExpr = new
DynamoDBQueryExpression<Customer>()
    .withRangeKeyCondition("Email",
        new Condition()
            .withComparisonOperator(ComparisonOperator.BEGINS_WITH)
            .withAttributeValueList(
                new AttributeValue().withS("my")));
```

```
mapper.query(Customer.class, emailBwQueryExpr);
```

In v2, instead of using a configuration object, you set parameters on the request object by using a builder. For example:

```
QueryEnhancedRequest emailBw = QueryEnhancedRequest.builder()
    .queryConditional(QueryConditional
        .sortBeginsWith(kb -> kb
            .sortValue("my")))
    .build();

customerTable.query(emailBw);
```

Conditionals

In v2, conditional and filtering expressions are expressed using an Expression object, which encapsulates the condition and the mapping of names and filters.

Use case	Operations	v1	v2
Expected attribute conditionals	save(), delete(), query(), scan()	<pre>new DynamoDBSaveExpression() .withExpected(Collections.singletonMap("otherAttribute", new ExpectedAttributeValue(false))) .withConditionalOperator(ConditionalOperator.AND);</pre>	Deprecated; use ConditionExpression instead.
Conditional expression	delete()	<pre>deleteExpression.setConditionExpression("zipcode = :zipcode")</pre>	<pre>Expression conditionExpression = Expression.builder() .expression("#key = :value OR #key1 = :value1") .putExpressionName("#key", "attribute")</pre>

Use case	Operations	v1	v2
		<pre>deleteExpression .setExpressionAttributeValues(...)</pre>	<pre> .putExpressionName ("#key1", "attribute3") .putExpressionValue (":value", AttributeValues.stringValue("wrong")) .putExpressionValue (":value1", AttributeValues.stringValue("three")) .build(); DeleteItemEnhancedRequest request = DeleteItemEnhancedRequest.builder() .conditionExpression(conditionExpression).build();</pre>
Filter expression	query(), scan()	<pre>scanExpression .withFilterExpression("#statename = :state") .withExpressionAttributeValues(attributeValueMapBuilder.build()) .withExpressionAttributeNames(attributeNameMapBuilder.build())</pre>	<pre>Map<String, AttributeValue> values = singletonMap(":key", stringValue("value")); Expression filterExpression = Expression.builder() .expression("name = :key") .expressionValues(values) .build(); QueryEnhancedRequest request = QueryEnhancedRequest.builder() .filterExpression(filterExpression).build();</pre>

Use case	Operations	v1	v2
Conditional expression for query	query()	<pre>queryExpression.withKeyConditionExpression()</pre>	<pre>QueryConditional keyEqual = QueryConditional.keyEqualTo(b -> b .partitionValue("movie01")); QueryEnhancedRequest tableQuery = QueryEnhancedRequest.builder() .queryConditional(keyEqual) .build();</pre>

Type conversion

Default converters

In v2, the SDK provides a set of default converters for all common types. You can change type converters both at the overall provider level as well as for a single attribute. You can find a list of the available converters in the [AttributeConverter](#) API reference.

Set a custom converter for an attribute

In v1, you can annotate a getter method with `@DynamoDBTypeConverted` to specify the class that converts between the Java attribute type and a DynamoDB attribute type. For instance, a `CurrencyFormatConverter` that converts between a Java `Currency` type and DynamoDB `String` can be applied as shown in the following snippet.

```
@DynamoDBTypeConverted(converter = CurrencyFormatConverter.class)
public Currency getCurrency() { return currency; }
```

The v2 equivalent of the previous snippet is shown below.

```
@DynamoDbConvertedBy(CurrencyFormatConverter.class)
public Currency getCurrency() { return currency; }
```

Note

In v1, you can apply the annotation to the attribute itself, a type or a user-defined annotation, v2 supports applying the annotation it only to the getter.

Add a type converter factory or provider

In v1, you can provide your own set of type converters, or override the types you care about by adding a type converter factory to the configuration. The type converter factory extends `DynamoDBTypeConverterFactory`, and overrides are done by getting a reference to the default set and extending it. The following snippet demonstrates how to do this.

```
DynamoDBTypeConverterFactory typeConverterFactory =
    DynamoDBTypeConverterFactory.standard().override()
        .with(String.class, CustomBoolean.class, new DynamoDBTypeConverter<String,
CustomBoolean>() {
            @Override
            public String convert(CustomBoolean bool) {
                return String.valueOf(bool.getValue());
            }
            @Override
            public CustomBoolean unconvert(String string) {
                return new CustomBoolean(Boolean.valueOf(string));
            }
        }).build();
DynamoDBMapperConfig config =
    DynamoDBMapperConfig.builder()
        .withTypeConverterFactory(typeConverterFactory)
        .build();
DynamoDBMapper mapperWithTypeConverterFactory = new DynamoDBMapper(dynamo, config);
```

V2 provides similar functionality through the `@DynamoDbBean` annotation. You can provide a single `AttributeConverterProvider` or a chain of ordered `AttributeConverterProviders`. Note that if you supply your own chain of attribute converter providers, you will override the default converter provider and must include it in the chain to use its attribute converters.

```
@DynamoDbBean(converterProviders = {
    ConverterProvider1.class,
    ConverterProvider2.class,
    DefaultAttributeConverterProvider.class})
```

```
public class Customer {
    ...
}
```

The section on [attribute conversion](#) in this guide contains a complete example for v2.

Document API

The Document API supports working with JSON-style documents as single items in a DynamoDB table. The v1 Document API has a corresponding API in v2, but instead of using a separate client for the document API as in v1, v2 incorporates document API features in the DynamoDB enhanced client.

In v1, the [Item](#) class represents an unstructured record from a DynamoDB table. In v2, an unstructured record is represented by an instance of the [EnhancedDocument](#) class. Note that primary keys are defined in the table schema for v2, and on the item itself in v1.

The table below compares the differences between the Document APIs in v1 and v2.

Use case

v1

v2

Create a document client

```
AmazonDynamoDB client
= ... //Create a client.
DynamoDB documentClient
= new DynamoDB(client);
```

```
// The v2 Document API
uses the same DynamoDbEnhancedClient
// that is used for
mapping POJOs.
DynamoDbClient
standardClient
= ... //Create a
standard client.
DynamoDbEnhancedClient enhancedClient
= ... // Create an
enhanced client.
```

Reference a table

```
Table documentTable
= docClient.documentClient("Person");
```

```
DynamoDbTable<EnhancedDocument>
documentTable =
enhancedClient.table("Person",
```

Use case**v1****v2**

```

        TableSchema
        ma.documentSchemaBuilder()
            .addIndex(
                PartitionKey(Table
                Metadata.primaryIndexName(), "id",
                AttributeValueType.S)
            .attributeConverterProviders(
                AttributeConverterProvider.defaultProvider())
            .build())
    ;

```

Work with semi-structured data**Put item**

```

Item item = new Item()
    .withPrimaryKey("id", 50)
    .withString("firstName", "Shirley");
PutItemOutcome outcome
    = documentTable.putItem(item);

```

```

EnhancedDocument
    personDocument =
        EnhancedDocument.builder()
            .putNumber("id", 50)
            .putString("firstName",
                "Shirley")
            .build();
documentTable.putItem(personDocument);

```

Use case**v1****v2****Get item**

```

getItemOutcome outcome
    = documentTable.getItemOutcome( "id", 50);
Item personDocFromDb =
    outcome.getItem();
String firstName =
    personDocFromDb.getString("firstName");

```

```

EnhancedDocument
    personDocFromDb =
        documentTable
            .getItem(
                Key.builder()
                    .partitionValue(50)
                    .build());
String firstName =
    personDocFromDb.getString("firstName");

```

Work with JSON items**Convert a JSON structure to use it with the Document API**

```

// The 'jsonPerson'
// identifier is a JSON
// string.
Item item = new Item().fromJSON(jsonPerson);

```

```

// The 'jsonPerson'
// identifier is a JSON
// string.
EnhancedDocument
    document = EnhancedDocument.builder()
        .json(jsonPerson).build();

```

Put JSON

```

documentTable.putItem(item)

```

```

documentTable.putItem(document);

```

Read JSON

```

getItemOutcome outcome
    = //Get item.
String jsonPerson =
    outcome.getItem().toJSON();

```

```

String jsonPerson =
    documentTable.getItem(Key.builder()
        .partitionValue(50).build())
        .fromJson();

```

FAQ

Q. Does optimistic locking with a version number work the same way in v2 as in v1?

A. The behavior is similar, but v2 does not automatically add conditions for the delete operations. You must add condition expressions manually if you want to control the delete behavior.

Changes in automatic Amazon SQS request batching from version 1 to version 2

This topic details the changes in automatic request batching for Amazon SQS between version 1 and version 2 of the AWS SDK for Java.

High-level changes

The AWS SDK for Java 1.x performs client-side buffering using a separate [AmazonSQSBufferedAsyncClient](#) class that requires explicit initialization for request batching.

The AWS SDK for Java 2.x simplifies and enhances buffering functionality with the [SqsAsyncBatchManager](#). The implementation of this interface provides automatic request batching capabilities directly integrated with the standard [SqsAsyncClient](#). To learn about v2's [SqsAsyncBatchManager](#), see the [the section called "Use automatic request batching"](#) topic in this guide.

Change	v1	v2
Maven dependencies	<pre><dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> 1.12.782</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-sqs</ artifactId> </dependency> </dependencies></pre>	<pre><dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> 2.31.15</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>sqs</artifactId> </dependency> </dependencies></pre>

Class names	AmazonSQSBufferedA syncClient	SqsAsyncBatchManager

¹ [Latest version.](#)

² [Latest version.](#)

Using automatic SQS request batching

Change	v1	v2
Create a batch manager	<pre> AmazonSQSAsync sqsAsync = new AmazonSQS AsyncClient(); AmazonSQSAsync bufferedSqs = new AmazonSQS BufferedAsyncClien t(sqsAsync); </pre>	<pre> SqsAsyncClient asyncClient = SqsAsyncClient.cre ate(); SqsAsyncBatchManager sqsAsyncBatchManager = asyncClie nt.batchManager(); </pre>
Create a batch manager with custom configuration	<pre> AmazonSQSAsync sqsAsync = new AmazonSQS AsyncClient(); QueueBufferConfig queueBufferConfig = new QueueBufferConfig() .withMaxB atchOpenMs(200) .withMaxB atchSize(10) .withMinR eceiveWaitTimeMs(1 000) .withVisi bilityTimeoutSecon ds(20) .withRece iveMessageAttribut eNames(messageAttr ibuteValues); AmazonSQSAsync bufferedSqs = new AmazonSQS BufferedAsyncClien </pre>	<pre> BatchOverrideConfi guration batchOver rideConfiguration = BatchOverrideConfi guration.builder() .sendRequ estFrequency(Durat ion.ofMillis(200)) .maxBatch Size(10) .receiveM essageMinWaitDurat ion(Duration.ofMil lis(1000)) .receiveM essageVisibilityTi meout(Duration.ofS econds(20)) .receiveM essageSystemAttrib uteNames(messageSy stemAttributeNames) .receiveM essageAttributeNam es(messageAttribut eValues) .build(); </pre>

Change	v1	v2
	<pre>t(sqsAsync, queueBufferConfig);</pre>	<pre>SqsAsyncBatchManager sqsAsyncBatchManager = SqsAsyncBatchManager. builder() .override Configuration(batchOverrideConfiguration) .client(SqsAsyncClient.create()) .schedule dExecutor(Executors.newScheduledThreadPool(8)) .build();</pre>
Send messages	<pre>Future<SendMessageResult> sendResultFuture = bufferedSqs.sendMessageAsync(new SendMessageRequest() .withQueueUrl(queueUrl) .withMessageBody(body));</pre>	<pre>CompletableFuture<SendMessageResponse> sendCompletableFuture = sqsAsyncBatchManager.sendMessage(SendMessageRequest. builder() .queueUrl(queueUrl) .messageBody(body) .build());</pre>

Change	v1	v2
Delete messages	<pre>Future<DeleteMessageResult> deleteResultFuture = bufferedSqs.deleteMessageAsync(new DeleteMessageRequest() .withQueueUrl(queueUrl));</pre>	<pre>CompletableFuture<DeleteMessageResponse> deleteResultCompletableFuture = sqsAsyncBatchManager.deleteMessage(DeleteMessageRequest.builder() .queueUrl(queueUrl) .build());</pre>
Change visibility of messages	<pre>Future<ChangeMessageVisibilityResult> changeVisibilityResultFuture = bufferedSqs.changeMessageVisibilityAsync (new ChangeMessageVisibilityRequest() .withQueueUrl(queueUrl) .withVisibilityTimeout(20));</pre>	<pre>CompletableFuture<ChangeMessageVisibilityResponse> changeResponseCompletableFuture = sqsAsyncBatchManager.changeMessageVisibility(ChangeMessageVisibilityRequest.builder() .queueUrl(queueUrl) .visibilityTimeout(20) .build());</pre>

Change	v1	v2
Receive messages	<pre> ReceiveMessageResult receiveResult = bufferedS qs.receiveMessage(new ReceiveMessageRequ est() .withQueueUrl(queue eUrl)); </pre>	<pre> CompletableFuture< ReceiveMessageResp onse> responseC ompletableFuture = sqsAsyncBatchManag er.receiveMessage(ReceiveMessageRequ est.builder() .queueUrl(queueUrl) .build()); </pre>

Asynchronous return type differences

Change	v1	v2
Return type	Future<ResultType>	CompletableFuture<ResponseType>
Callback mechanism	Requires an AsyncHandler with separate onSuccess and onError methods	Uses CompletableFuture APIs provided by the JDK, such as whenComplete(), thenCompose(), thenApply()
Exception handling	Uses AsyncHandler#onError() method	Uses CompletableFuture APIs provided by the JDK, such as exceptionally(), handle(), or whenComplete()
Cancellation	Basic support through Future.cancel()	Cancelling a parent CompletableFuture

Change	v1	v2
		automatically cancels all dependent futures in the chain

Asynchronous completion handling differences

Change	v1	v2
Response handler implementation	<pre>Future<ReceiveMessageResult> future = bufferedSqs.receiveMessageAsync(receiveRequest, new AsyncHandler<ReceiveMessageRequest, ReceiveMessageResult>() { @Override public void onSuccess(ReceiveMessageRequest request, ReceiveMessageResult result) { List<Message> messages = result.getMessages (); System.out.println ("Received " + messages.size() + " messages"); for (Message message : messages) { System.out.println</pre>	<pre>CompletableFuture< ReceiveMessageResponse> completableFuture = sqsAsyncBatchManager .receiveMessage(ReceiveMessageRequest.builder() .queueUrl (queueUrl).build()) .whenComplete((receiveMessageResponse, throwable) -> { if (throwable != null) { System.err.println ("Error receiving messages: " + throwable .getMessage()); throwable.printStackTrace(); } else { List<Message> messages = receiveMessageResponse.messages(); System.out.println</pre>

Change	v1	v2
	<pre> ("Message ID: " + message.getMessage Id()); System.out.println ("Body: " + message.g etBody()); } } @Override public void onError(Exception e) { System.err.println ("Error receiving messages: " + e.getMess age()); e.printStackTrace(); } }); </pre>	<pre> ("Received " + messages.size() + " messages"); for (Message message : messages) { System.out.println ("Message ID: " + message.messageId()); System.out.println ("Body: " + message.b ody()); } } }); </pre>

Key configuration parameters

Parameter	v1	v2
Maximum batch size	maxBatchSize (default 10 requests per batch)	maxBatchSize (default 10 requests per batch)
Batch wait time	maxBatchOpenMs (default 200 ms)	sendRequestFrequency (default 200 ms)
Visibility timeout	visibilityTimeoutSeconds (-1 for queue default)	receiveMessageVisi bilityTimeout (queue default)

Parameter	v1	v2
Minimum wait time	<code>longPollWaitTimeOutSeconds</code> (20s when <code>longPoll</code> is true)	<code>receiveMessageMinWaitDuration</code> (default 50 ms)
Message attributes	Set using <code>ReceiveMessageRequest</code>	<code>receiveMessageAttributeNames</code> (none by default)
System attributes	Set using <code>ReceiveMessageRequest</code>	<code>receiveMessageSystemAttributeNames</code> (none by default)
Long polling	<code>longPoll</code> (default is true)	Not supported to avoid open connections waiting until the server sends the messages
Maximum wait time for long polling	<code>longPollWaitTimeOutSeconds</code> (default 20s)	Not supported to avoid open connections waiting until the server sends the messages
Maximum number of prefetched receive batches stored client-side	<code>maxDoneReceiveBatches</code> (10 batches)	Not supported because it is handled internally
Maximum number of active outbound batches processed simultaneously	<code>maxInflightOutboundBatches</code> (default 5 batches)	Not supported because it is handled internally
Maximum number of active receive batches processed simultaneously	<code>maxInflightReceiveBatches</code> (default 10 batches)	Not supported because it is handled internally

Use the SDK for Java 1.x and 2.x side-by-side

You can use both versions of the AWS SDK for Java in your projects.

The following shows an example of the `pom.xml` file for a project that uses Amazon S3 from version 1.x and DynamoDB from version 2.27.21.

Example Example of POM

This example shows a `pom.xml` file entry for a project that uses both 1.x and 2.x versions of the SDK.

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>com.amazonaws</groupId>
      <artifactId>aws-java-sdk-bom</artifactId>
      <version>1.12.1</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>bom</artifactId>
      <version>2.27.21</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>

<dependencies>
  <dependency>
    <groupId>com.amazonaws</groupId>
    <artifactId>aws-java-sdk-s3</artifactId>
  </dependency>
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>dynamodb</artifactId>
  </dependency>
</dependencies>
```

OpenPGP key for the AWS SDK for Java

All publicly available Maven artifacts for the AWS SDK for Java are signed using the OpenPGP standard. The public key that you need to verify the signature of an artifact is available in the following section.

Current key

The following table shows OpenPGP key information for the current releases of the SDK for Java 1x and SDK for Java 2.x.

Key ID	0xAC107B386692DADD
Type	RSA
Size	4096/4096
Created	2016-06-30
Expires	2025-10-04
User ID	AWS SDKs and Tools <aws-dr-tools@amazon.com>
Key fingerprint	FEB9 209F 2F2F 3F46 6484 1E55 AC10 7B38 6692 DADD

To copy the following OpenPGP public key for the SDK for Java to the clipboard, select the "Copy" icon in the upper right corner.

Historical keys

Important

New keys are created before the previous ones expire. As a result, at any given moment in time, more than one key may be valid. Keys are used to sign artifacts starting the day they are created, so use the more recently-issued key when the validities of keys overlap.

The following table shows older OpenPGP key information for releases of the SDK for Java 1x and SDK for Java 2.x.

Key ID	0xAC107B386692DADD
Type	RSA
Size	4096/4096
Created	2016-06-30
Expires	2024-10-08
User ID	AWS SDKs and Tools <aws-dr-tools@amazon.com>
Key fingerprint	FEB9 209F 2F2F 3F46 6484 1E55 AC10 7B38 6692 DADD

To copy the following OpenPGP public key for the SDK for Java to the clipboard, select the "Copy" icon in the upper right corner.

```

Document history

This topic describes important changes to the AWS SDK for Java Developer Guide over the course of its history.

Change	Description	Date
Table of contents reorganization	??? chapter was added and topics were moved to it from other parts of the guide.	June 16, 2025
???	Added information about using the LegacyMd5 Plugin for backward compatibility with systems that require MD5 checksums.	May 19, 2025
the section called "S3 client differences"	Add S3 client differences between v1 and v2 of the AWS SDK for Java and provide migration examples if the migration tool cannot automatically migrate the V1 code.	April 24, 2025
Deserialization differences	Add deserialization difference between v1 and v2 of the SDK for Java.	April 10, 2025
the section called "SQS automatic request batching"	Add migration content for SQS automatic request batching from v1 to v2 of the SDK for Java.	April 8, 2025
???	Update information about automatic checksum calculations	April 3, 2025

Change	Description	Date
the section called “Configure ALPN”	Show configuration of ALPN protocol negotiation with the Netty-based HTTP client.	February 21, 2025
the section called “From Lambda functions”	Add information about using the EMF logging metric publisher with AWS Lambda to capture SDK metrics.	February 6, 2025
Implement ContentStreamProvider	Add topic on how to implement a ContentStreamProvider .	January 29, 2025
the section called “Data integrity protection with checksums”	Content updated with details about automatic checksum calculation.	January 16, 2025
the section called “Working with Amazon S3”	Add migration content for working with Amazon S3.	January 8, 2025
the section called “Access the AWS CRT-based HTTP clients”	Add information about how to used a platform-specific jar with AWS CRT-based components.	November 14, 2024
the section called “Use IAM Roles Anywhere for authentication”	Add information about how to use IAM Roles Anywhere for authentication.	November 6, 2024
the section called “Caching credentials configuration example”	Add an example that configures a credentials provider by using the <code>asyncCredentialUpdateEnabled</code> property.	November 4, 2024

Change	Description	Date
the section called "Use automatic request batching"	Add a new topic that documents the Automatic Request Batching API for Amazon SQS.	October 23, 2024
OpenPGP key	Update current OpenPGP key information.	October 10, 2024
the section called "Use complex types in expressions" and the section called "Update items that contain complex types"	Add content for how to work with complex types in expressions and updates.	October 10, 2024
Update Amazon S3 bucket names	Update Amazon S3 bucket names.	September 30, 2024
the section called "Use AWS account-based endpoints"	Add information about AWS account-based endpoints for DynamoDB.	September 24, 2024
the section called "Work with attributes that are beans, maps, lists and sets"	Update section for DynamoDB Enhance Client that discusses working with attributes that are complex types.	September 6, 2024
the section called "Configure service clients to shortcut lookups"	Clarify use of the <code>EnvironmentVariableCredentialsProvider</code> when Lambda SnapStart for Java is used.	August 19, 2024
the section called "Configure parallel transfer support"	Add page with information on how to enable parallel transfer support	August 15, 2024

Change	Description	Date
the section called "AutoGeneratedUuidExtension"	Add information about the DynamoDB Enhanced Client AutoGeneratedUuidExtension	August 14, 2024
???	Add a section about the migration tool (preview release)	August 9, 2024
the section called "S3 Event Notifications"	Add section that discusses how to work with the S3 Event Notifications API	July 21, 2024
the section called "DynamoDB mapping/document APIs"	Add v1 to v2 migration information for the DynamoDB mapping/document APIs	July 21, 2024
the section called "S3 Event Notifications"	Add v1 to b2 migration information for the S3 Event Notifications API	July 21, 2024
the section called "Retries"	Add retry strategy topic	June 18, 2024
How to set the JVM TTL	Remove instructions to set <code>networkaddress.cache.ttl</code> security property by using a java command-line system property.	May 21, 2024
the section called "Reduce SDK startup time for AWS Lambda"	Update HTTP client recommendation to reduce startup time for AWS Lambda	May 14, 2024
the section called "Metrics reference"	Reorganize metrics table items	May 1, 2024

Change	Description	Date
the section called “Troubleshooting”	Add troubleshooting topic.	April 26, 2024
the section called “Metrics collected with each request”	Add new metrics reported by the SDK.	April 26, 2024
the section called “Set the JVM TTL for DNS name lookups”	Change recommended DNS lookup TTL to 5 seconds.	April 23, 2024
the section called “Package name to artifactId mappings”	Add package name to Maven artifactId mapping topic.	April 17, 2024
the section called “Metrics”	Add configuration details to the metrics section.	April 12, 2024
the section called “IAM Policy Builder API”	Add IAM Policy Builder API migration information.	April 11, 2024
???	Update HTTP proxy information.	April 3, 2024
the section called “Securely”	Add instructions to disable IMDSv1.	March 14, 2024
the section called “Step-by-step instructions”	Add step-by-step migration instructions.	March 8, 2024
Migrate to version 2	Update migration topic.	February, 14, 2024
the section called “Configure AWS CRT-based HTTP clients”	Add information about the synchronous AWS CRT-based HTTP client.	January 5, 2024

Change	Description	Date
the section called “Amazon Cognito Identity” and the section called “Amazon Cognito Identity Provider”	Amazon Cognito examples moved to Code Examples section.	December 28, 2023
Use SDK features	Reworked the SDK features topic.	December 11, 2023
OpenPGP key	Provide current OpenPGP key.	December 6, 2023
the section called “Serialization differences”	Describe serialization differences between v1 and v2 of the SDK for Java.	December 5, 2023
the section called “S3 Transfer Manager”	Add a section that details the changes in the S3 Transfer Manager from version 1 to version 2.	November 13, 2023
the section called “Annotation reference”	Add a listing of data class annotations that can be used with the DynamoDB Enhanced Client.	October 30, 2023
???	Add information on the migration status of libraries and utilities from SDK for Java v1.x to v2.x	October 17, 2023
???	Update the Gradle setup topic	October 17, 2023
the section called “Ignore null attributes of nested objects”	Add information about the DynamoDB Enhanced Client <code>@DynamoDbIgnoreNulls</code> annotation.	September 22, 2023

Change	Description	Date
the section called "Cross-Region access"	Add information about cross-Region access to Amazon S3 buckets.	August 31, 2023
the section called "Preserve empty objects"	Add section that discusses the <code>@DynamoDbPreserveEmptyObject</code> annotation.	August 25, 2023
???	Update service client section.	August 15, 2023
the section called "Client recommendations"	Since version 0.23, AWS CRT supports musl-based OS such as Alpine Linux. HTTP client recommendations now reflect the musl support.	August 11, 2023
the section called "Create IAM policies"	Add IAM Policy Builder API section	July 31, 2023
the section called "Get started"	Correct several snippets in the Get Started section of the DynamoDB Enhanced Client topic.	July 24, 2023
the section called "Configure HTTP proxies"	Add HTTP proxy support information and examples for each HTTP client.	June 2, 2023
Reorganize the table of contents	Promote Code examples section and Work with AWS services to top-level TOC entries.	May 24, 2023
the section called "Add logging dependency"	Show Gradle dependencies in logging section.	May 23, 2023

Change	Description	Date
the section called "Work with paginated results"	Update pagination topic.	May 18, 2023
the section called "Set up a Gradle project"	Update Gradle project setup.	May 3, 2023
DynamoDB Enhanced Client API	Rewritten DynamoDB Enhanced Client API topic released.	April 28, 2023
Update get started tutorial instructions	Maven archetype modified to include option for credentialsProvider; instructions modified accordingly.	April 11, 2023
the section called "Client recommendations"	Add HTTP client decision guidance	March 30, 2023
IAM best practices updates	Updated guide to align with the IAM best practices . For more information, see Security best practices in IAM .	March 14, 2023
the section called "Reload profile credentials"	Add section on reloading profile credentials.	February 9, 2023
the section called "Configure AWS CRT-based HTTP clients"	Update topic for GA release.	February 8, 2023
the section called "Work with Amazon EC2 instance metadata"	Add guided example for Java SDK client for Amazon S3 instance metadata service.	February 1, 2023
the section called "Use a performant S3 client"	Add section for the AWS CRT-based S3 Client.	December 19, 2022

Change	Description	Date
the section called "Transfer files and directories"	Update Amazon S3 Transfer Manager examples for GA release.	December 19, 2022
the section called "Best practices"	Added best practices section.	November 18, 2022
the section called "Use an external process"	Added section on loading credentials from an external process.	November 15, 2022
the section called "Metrics reference"	Updated metric listing with HTTP client usage requirement.	November 9, 2022
the section called "Transfer files and directories"	Example code corrected.	November 2, 2022
the section called "Reduce SDK startup time for AWS Lambda"	Updated section with additional options to reduce Lambda startup time.	November 1, 2022
the section called "Configure HTTP clients"	Added configuration information to cover all HTTP clients in the SDK.	October 26, 2022
the section called "Logging"	Updated logging topic to include wire logging details for all HTTP clients.	October 4, 2022
the section called "AWS database services"	Added overview section of AWS database services and the SDK for Java 2.x.	September 13, 2022
EC2-Classic Networking is Retiring	EC2-Classic is retiring on August 15, 2022.	July 28, 2022

Change	Description	Date
the section called "Additional authentication options"	Update to dependency required for single sign-on authentication.	July 18, 2022
the section called "Transport Layer Security (TLS)"	Update TLS security information.	April 8, 2022
the section called "Additional authentication options"	Added more information about setting up and using credentials.	February 22, 2021
the section called "Set up a GraalVM Native Image project"	New topic for setting up a GraalVM Native Image project.	February 18, 2021
the section called "Poll for resource states"	Waiters released; added topic for the new feature.	September 30, 2020
the section called "Metrics"	Metrics released; added topic for the new feature.	August 17, 2020
the section called "Amazon SNS"	Added example topics for Amazon SNS.	May 30, 2020
the section called "Reduce SDK startup time for AWS Lambda"	Added AWS Lambda function performance topic.	May 29, 2020
the section called "Set the JVM TTL for DNS name lookups"	Added JVM TTL DNS caching topic.	April 27, 2020
the section called "Set up an Apache Maven project", the section called "Set up a Gradle project"	New Maven and Gradle set up topics.	April 21, 2020

Change	Description	Date
the section called “Transport Layer Security (TLS)”	Added TLS 1.2 to security section.	March 19, 2020
the section called “Subscribe to Amazon Kinesis Data Streams”	Added Kinesis stream examples.	August 2, 2018
the section called “Work with paginated results”	Added auto pagination topic.	April 5, 2018
???	Added example topics for IAM, Amazon EC2, CloudWatch and DynamoDB.	December 29, 2017
the section called “Amazon S3”	Added getobjects example for Amazon S3.	August 7, 2017
the section called “Use asynchronous programming”	Added async topic.	August 4, 2017
GA release of the AWS SDK for Java 2.x	AWS SDK for Java version 2 (v2) released.	June 28, 2017
